- Grade-separated right-of-way, including bus only lanes (for buses, emergency vehicles, and sometimes taxis), and other Transit Priority measures. Some systems use guideways which automatically steer the bus on portions of the route.
- Frequent, high-capacity service
- High-quality vehicles that are easy to board, quiet, clean, and comfortable to ride.
- Pre-paid fare collection to minimize boarding delays.
- Integrated fare systems, allowing free or discounted transfers between routes and modes.
- Convenient user information and marketing programs.
- High quality bus stations with Transit Oriented Development in nearby areas.
- Modal integration, with BRT service coordinated with walking and cycling facilities, taxi services, intercity bus, rail transit, and other transportation services.

BRT systems vary significantly in the level of travel efficiency offered above and beyond “identity” features and BRT branding. The following effectiveness ranges represent general guidelines. Each proposed BRT should be evaluated specifically based on its characteristics in terms of time savings, cost, efficiency, and way-finding advantages. These types of features encourage people to use public transit and therefore reduce VMT.

Measure Applicability:

- Urban and suburban context
- Negligible in a rural context. Other measures are more appropriate to rural areas, such as express bus service to urban activity centers with park-and-ride lots at system-efficient rural access points.
- Appropriate for specific or general plans

Baseline Method:

See introduction to transportation section for a discussion of how to estimate trip rates and VMT. The CO_2 emissions are calculated from VMT as follows:

$$CO_2 = VMT \times EF_{running}$$

Where:

VMT = vehicle miles traveled

$EF_{running}$ = emission factor for running emissions

Inputs:

The following information needs to be provided by the Project Applicant:

- Existing transit mode share
- Percentage of lines serving Project converting to BRT

The following are optional inputs. Average (default) values are included in the calculations but can be updated to project specificity if desired. Please see Appendix C for calculation detail:

- Average vehicle occupancy

Mitigation Method:

% VMT Reduction = Riders * Mode * Lines * D

Where

Riders = % increase in transit ridership on BRT line (28% from [1])
Mode = Existing transit mode share (see table below)
Lines = Percentage of lines serving project converting to BRT
D = Adjustments from transit ridership increase to VMT (0.67, see Appendix C)

Project setting	Transit mode share
Suburban	1.3%
Urban	4%
Urban Center	17%
Source: NHTS, 2001 http://www.dot.ca.gov/hq/tsip/tab/documents/travelsurveys/Final2001_StwTravelSurveyWkdayRpt.pdf (Urban – MTC, SACOG. Suburban – SCAG, SANDAG, Fresno County.) Urban Center from San Francisco County Transportation Authority Countywide Transportation Plan, 2000.	

- D: 0.67 (see Appendix C for detail)

Assumptions:

Data based upon the following references:

[1] FTA, August 2005. "Las Vegas Metropolitan Area Express BRT Demonstration Project", NTD, http://www.ntdprogram.gov/ntdprogram/cs?action=showRegionAgencies&region=9

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions[70]
CO_2e	0.02 – 3.2% of running
PM	0.02 – 3.2% of running
CO	0.02 – 3.2% of running
NOx	0.02 – 3.2% of running
SO_2	0.02 – 3.2% of running
ROG	0.012 – 1.9% of total

Discussion:

Increases in transit ridership due to shifts from other lines do not need to be addressed since it is already incorporated in the literature.

In general, transit operational strategies alone are not enough for a large modal shift [2], as evidenced by the low range in VMT reductions. Through case study analysis, the TCRP report [2] observed that strategies that focused solely on improving level of service or quality of transit were unsuccessful at achieving a significant shift. Strategies that reduce the attractiveness of vehicle travel should be implemented in combination to attract a larger shift in transit ridership. The three following factors directly impact the attractiveness of vehicle travel: urban expressway capacity, urban core density, and downtown parking availability.

Example:

Sample calculations are provided below:

- Low Range % VMT Reduction (suburban,10% of lines) = 28% * 1.3% * 10% * 0.67 = 0.02%

[70] The percentage reduction reflects emission reductions from running emissions. The actual value will be less than this when starting and evaporative emissions are factored into the analysis. ROG emissions have been adjusted to reflect a ratio of 40% evaporative and 60% exhaust emissions based on a statewide EMFAC run of all vehicles.

- High Range % VMT Reduction (urban, 100% of lines) = 28% * 17% * 100% * 0.67 = 3.2%

Preferred Literature:

- 28% increase in transit ridership in the existing corridor

The FTA study [1] looks at the implementation of the Las Vegas BRT system. The BRT supplemented an existing route along a 7.5 mile corridor. The existing route was scaled back. Total ridership on the corridor (both routes combined) increased 61,704 monthly riders, 28% increase on the existing corridor and 1.4% increase in system ridership. The route represented an increase in 2.1% of system service miles provided.

Alternative Literature:

Alternate:

- 27-84% increase in total transit ridership

Various bus rapid transit systems obtained the following total transit ridership growth: Vancouver 96B (30%), Las Vegas Max (35-40%), Boston Silver Line (84%), Los Angeles (27-42%), and Oakland (66%). VTPI [3] obtained the BRT data from BC Transit's unpublished research. The effectiveness of a BRT strategy depends largely on the land uses the BRT serves and their design and density.

Alternate:

- 50% increase in weekly transit ridership
- 60 – 80% shorter travel time compared to vehicle trip

The Martin Luther King, Jr. East Busway in Pennsylvania opened in 1983 as a separate roadway exclusively for public buses. The busway was 6.8 miles long with six stations. Ridership has grown from 20,000 to 30,000 weekday riders over 10 years. The busway saves commuters significant time compared with driving: 12 minutes versus 30-45 minutes in the AM or an hour in the PM [4].

3.5.2 Implement Transit Access Improvements

Range of Effectiveness: Grouped strategy. [See TST-3 and TST-4]

Measure Description:

This project will improve access to transit facilities through sidewalk/ crosswalk safety enhancements and bus shelter improvements. The benefits of Transit Access Improvements alone have not been quantified and should be grouped with Transit Network Expansion (TST-3) and Transit Service Frequency and Speed (TST-4).

Measure Applicability:

- Urban, suburban context
- Appropriate for residential, retail, office, mixed use, and industrial projects

Alternative Literature:

No literature was identified that specifically looks at the quantitative impact of improving transit facilities as a standalone strategy.

Alternative Literature References:

None

Other Literature Reviewed:

None

3.5.3 Expand Transit Network

Range of Effectiveness: 0.1 – 8.2% vehicle miles travelled (VMT) reduction and therefore 0.1 – 8.2% reduction in GHG emissions[71]

Measure Description:

The project will expand the local transit network by adding or modifying existing transit service to enhance the service near the project site. This will encourage the use of transit and therefore reduce VMT.

Measure Applicability:

- Urban and suburban context
- May be applicable in a rural context but no literature documentation available (effectiveness will be case specific and should be based on specific assessment of levels of services and origins/destinations served)
- Appropriate for specific or general plans

Baseline Method:

See introduction to transportation section for a discussion of how to estimate trip rates and VMT. The CO_2 emissions are calculated from VMT as follows:

$$CO_2 = VMT \times EF_{running}$$

Where:

VMT = vehicle miles traveled

$EF_{running}$ = emission factor for running emissions

Inputs:

The following information needs to be provided by the Project Applicant:

- Percentage increase transit network coverage
- Existing transit mode share
- Project location: urban center, urban, or suburban

[71] Transit vehicles may also result in increases in emissions that are associated with electricity production or fuel use. The Project Applicant should consider these potential additional emissions when estimating mitigation for these measures.

The following are optional inputs. Average (default) values are included in the calculations but can be updated to project specificity if desired. Please see Appendix C for calculation detail:

- Average vehicle occupancy

Mitigation Method:

% VMT Reduction = Coverage * B * Mode * D

Where

Coverage = % increase in transit network coverage
B = elasticity of transit ridership with respect to service coverage (see Table below)
Mode = existing transit mode share
D = adjustments from transit ridership increase to VMT (0.67, from Appendix C)

B:

Project setting	Elasticity
Suburban	1.01
Urban	0.72
Urban Center	0.65
Source: TCRP 95, Chapter 10	

Mode: Provide existing transit mode share for project or utilize the following averages

Project setting	Transit mode share
Suburban	1.3%
Urban	4%
Urban Center	17%
Source: NHTS, 2001http://www.dot.ca.gov/hq/tsip/tab/documents/travelsurveys/Final2001_StwTravelSurveyWkdayRpt.pdf (Urban – MTC, SACOG. Suburban – SCAG, SANDAG, Fresno County.) Urban Center from San Francisco County Transportation Authority Countywide Transportation Plan, 2000.	

Assumptions:

Data based upon the following references:

[1] Transit Cooperative Research Program. TCRP Report 95 Traveler Response to System Changes – Chapter 10: Bus Routing and Coverage. 2004. (p. 10-8 to 10-10)

Emission Reduction Ranges and Variables:

Pollut0ant	Category Emissions Reductions[72]
CO_2e	0.1 – 8.2% of running
PM	0.1 – 8.2% of running
CO	0.1 – 8.2% of running
NOx	0.1 – 8.2% of running
SO_2	0.1 – 8.2% of running
ROG	0.06 – 4.9% of total

Discussion:

In general, transit operational strategies alone are not enough for a large modal shift [2], as evidenced by the low range in VMT reductions. Through case study analysis, the TCRP report [2] observed that strategies that focused solely on improving level of service or quality of transit were unsuccessful at achieving a significant shift. Strategies that reduce the attractiveness of vehicle travel should be implemented in combination to attract a larger shift in transit ridership. The three following factors directly impact the attractiveness of vehicle travel: urban expressway capacity, urban core density, and downtown parking availability.

Example:

Sample calculations are provided below:

- Low Range % VMT Reduction (10% expansion, suburban) = 10% * 1.01 * 1.3% * .67 = 0.1%
- High Range % VMT Reduction (100% expansion, urban) = 100% * 0.72 * 17% * .67 = 8.2%

The low and high ranges are estimates and may vary based on the characteristics of the project.

[72] The percentage reduction reflects emission reductions from running emissions. The actual value will be less than this when starting and evaporative emissions are factored into the analysis. ROG emissions have been adjusted to reflect a ratio of 40% evaporative and 60% exhaust emissions based on a statewide EMFAC run of all vehicles.

Preferred Literature:

- 0.65 = elasticity of transit ridership with respect to service coverage/expansion (in radial routes to central business districts)
- 0.72 = elasticity of transit ridership with respect to service coverage/expansion (in central city routes)
- 1.01 = elasticity of transit ridership with respect to service coverage/expansion (in suburban routes)

TCRP 95 Chapter 10 [1] documents the results of system-wide service expansions in San Diego. The least sensitivity to service expansion came from central business districts while the largest impacts came from suburban routes. Suburban locations, with traditionally low transit service, tend to have greater ridership increases compared to urban locations which already have established transit systems. In general, there is greater opportunity in suburban locations.

Alternative Literature:

- -0.06 = elasticity of VMT with respect to transit revenue miles

Growing Cooler [3] modeled the impact of various urban variables (including transit revenue miles and transit passenger miles) on VMT, using data from 84 urban areas around the U.S.

Alternative Literature References:

[2] Transit Cooperative Research Program. TCRP 27 – Building Transit Ridership: An Exploration of Transit's Market Share and the Public Policies That Influence It (p.47-48). 1997. [cited in discussion section above]

[3] Ewing, et al, 2008. Growing Cooler – The Evidence on Urban Development and Climate Change. Urban Land Institute.

3.5.4 Increase Transit Service Frequency/Speed

Range of Effectiveness: 0.02 – 2.5% vehicle miles traveled (VMT) reduction and therefore 0.02 – 2.5% reduction in GHG emissions[73]

Measure Description:

This project will reduce transit-passenger travel time through more reduced headways and increased speed and reliability. This makes transit service more attractive and may result in a mode shift from auto to transit which reduces VMT.

Measure Applicability:

- Urban and suburban context
- May be applicable in a rural context but no literature documentation available (effectiveness will be case specific and should be based on specific assessment of levels of services and origins/destinations served)
- Appropriate for specific or general plans

Baseline Method:

See introduction to transportation section for a discussion of how to estimate trip rates and VMT. The CO_2 emissions are calculated from VMT as follows:

$$CO_2 = VMT \times EF_{running}$$

Where:

VMT = vehicle miles traveled

$EF_{running}$ = emission factor for running emissions

Inputs:

The following information needs to be provided by the Project Applicant:

- Percentage reduction in headways (increase in frequency)
- Level of implementation
- Project setting: urban center, urban, suburban
- Existing transit mode share

[73] Transit vehicles may also result in increases in emissions that are associated with electricity production or fuel use. The Project Applicant should consider these potential additional emissions when estimating mitigation for these measures.

The following are optional inputs. Average (default) values are included in the calculations but can be updated to project-specific values if desired. Please see Appendix C for calculation detail:

- Average vehicle occupancy

Mitigation Method:

% VMT Reduction = Headway * B * C * Mode * E

Where

Headway = % reduction in headways
B = elasticity of transit ridership with respect to increased frequency of service (from [1])
C = adjustment for level of implementation
Mode = existing transit mode share
E = adjustments from transit ridership increase to VMT

Detail:

- Headway: reasonable ranges from 15 – 80%
- B:

Setting	Elasticity
Urban	0.32
Suburban	0.36
Source: TCRP Report 95 Chapter 9	

- C:

Level of implementation = number of lines improved / total number of lines serving project	Adjustment
<50%	50%
>=50%	85%
Fehr & Peers, 2010.	

- Mode: Provide existing transit mode share for project or utilize the following averages

Project setting	Transit mode share
Suburban	1.3%
Urban	4%
Urban Center	17%
Source: NHTS, 2001http://www.dot.ca.gov/hq/tsip/tab/documents/travelsurveys/Final2001_StwTravelSurveyWkdayRpt.pdf (Urban – MTC, SACOG. Suburban – SCAG, SANDAG, Fresno County.)	

Urban Center from San Francisco County Transportation Authority Countywide Transportation Plan, 2000.

- E: 0.67 (see Appendix C for detail)

Assumptions:

Data based upon the following references:

[1] Transit Cooperative Research Program. TCRP Report 95 Traveler Response to System Changes – Chapter 9: Transit Scheduling and Frequency (p. 9-14)

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions[74]
CO_2e	0.02 – 2.5% % of running
PM	0.02 – 2.5% % of running
CO	0.02 – 2.5% % of running
NOx	0.02 – 2.5% % of running
SO_2	0.02 – 2.5% % of running
ROG	0.01 – 1.5% % of total

Discussion:

Reasonable ranges for reductions were calculated assuming existing 30-minute headways reduced to 25 minutes and 5 minutes to establish the estimated low and high reductions, respectively.

The level of implementation adjustment is used to take into account increases in transit ridership due to shifts from other lines. If increases in frequency are only applied to a percentage of the lines serving the project, then we conservatively estimate that 50% of the transit ridership increase is a shift from the existing lines. If frequency increases are applied to a majority of the lines serving the project, we conservatively assume at least some of the transit ridership (15%) comes from existing riders.

In general, transit operational strategies alone are not enough for a large modal shift [2], as evidenced by the low range in VMT reductions. Through case study analysis, the TCRP report [2] observed that strategies that focused solely on improving level of service or quality of transit were unsuccessful at achieving a significant shift. Strategies that reduce the attractiveness of vehicle travel should be implemented in combination to attract a larger shift in transit ridership. The three following factors directly impact the

[74] The percentage reduction reflects emission reductions from running emissions. The actual value will be less than this when starting and evaporative emissions are factored into the analysis. ROG emissions have been adjusted to reflect a ratio of 40% evaporative and 60% exhaust emissions based on a statewide EMFAC run of all vehicles.

attractiveness of vehicle travel: urban expressway capacity, urban core density, and downtown parking availability.

Example:

Sample calculations are provided below:

- Low Range % VMT Reduction (15% reduction in headways, suburban, <50% implementation) = 15% * 0.36 * 50% * 1.3% *0.67 = 0.02%
- High Range % VMT Reduction (80% reduction in headways, urban, >50% implementation) = 80% * 0.32 * 85% * 17% * 0.67 = 2.5%

Preferred Literature:

- 0.32 = elasticity of transit ridership with respect to transit service (urban)
- 0.36 – 0.38 = elasticity of transit ridership with respect to transit service (suburban)

TCRP 95 Chapter 9 [1] documents the results of frequency changes in Dallas. Increases in frequency are more sensitive in a suburban environment. Suburban locations, with traditionally low transit service, tend to have greater ridership increases compared to urban locations which already have established transit systems. In general, there is greater opportunity in suburban locations

Alternative Literature:

- 0.5 = elasticity of transit ridership with respect to increased frequency of service
- 1.5 to 2.3% increase in annual transit trips due to increased frequency of service
- 0.4-0.5 = elasticity of ridership with respect to increased operational speed
- 4% - 15% increase in annual transit trips due to increased operational speed
- 0.03-0.09% annual GHG reduction (for bus service expansion, increased frequency, and increased operational speed)

For increased frequency of service strategy, *Moving Cooler* [3] looked at three levels of service increases, 3%, 3.5% and 4.67% increases in service, resulting in a 1.5 – 2.3% increase in annual transit trips. For increased speed and reliability, Moving Cooler looked at three levels of speed/reliability increases. Improving travel speed by 10% assumed implementing signal prioritization, limited stop service, etc. over 5 years. Improving travel speed by 15% assumed all above strategies plus signal synchronization and intersection reconfiguration over 5 years. Improving travel speed by 30% assumed all above strategies and an improved reliability by 40%, integrated fare system, and implementation of BRT where appropriate. *Moving Cooler* calculates estimated 0.04-0.14% annual GHG reductions in combination with bus service expansion strategy.

3.5.5 Provide Bike Parking Near Transit

Range of Effectiveness: Grouped strategy. [See TST-3 and TST-4]

Measure Description:

Provide short-term and long-term bicycle parking near rail stations, transit stops, and freeway access points. The benefits of Station Bike Parking have no quantified impacts as a standalone strategy and should be grouped with Transit Network Expansion (TST-3) and Increase Transit Service Frequency and Speed (TST-4) to encourage multi-modal use in the area and provide ease of access to nearby transit for bicyclists.

Measure Applicability:

- Urban, suburban context
- Appropriate for residential, retail, office, mixed use, and industrial projects

Alternative Literature:

No literature was identified that specifically looks at the quantitative impact of including transit station bike parking.

Alternative Literature References:

None

Other Literature Reviewed:

None

3.5.6 Provide Local Shuttles

Range of Effectiveness: Grouped strategy. [See TST-4 and TST-5]

Measure Description:

The project will provide local shuttle service through coordination with the local transit operator or private contractor. The local shuttles will provide service to transit hubs, commercial centers, and residential areas. The benefits of Local Shuttles alone have not been quantified and should be grouped with Transit Network Expansion (TST-4) and Transit Service Frequency and Speed (TST-5) to solve the "first mile/last mile" problem. In addition, many of the CommuteTrip Reduction Programs (Section 2.4, TRP 1-13) also included local shuttles.

Measure Applicability:

- Urban, suburban context
- Appropriate for large residential, retail, office, mixed use, and industrial projects

Alternative Literature:

No literature was identified to support the effectiveness of this strategy alone.

Alternative Literature References:

None

Other Literature Reviewed:

None

3.6 Road Pricing/Management

3.6.1 Implement Area or Cordon Pricing

Range of Effectiveness: 7.9 – 22.0% vehicle miles traveled (VMT) reduction and therefore 7.9 – 22.0% reduction in GHG emissions.

Measure Description:

This project will implement a cordon pricing scheme. The pricing scheme will set a cordon (boundary) around a specified area to charge a toll to enter the area by vehicle. The cordon location is usually the boundary of a central business district (CBD) or urban center, but could also apply to substantial development projects with limited points of access, such as the proposed Treasure Island development in San Francisco. The cordon toll may be static/constant, applied only during peak periods, or be variable, with higher prices during congested peak periods. The toll price can be based on a fixed schedule or be dynamic, responding to real-time congestion levels. It is critical to have an existing, high quality transit infrastructure for the implementation of this strategy to reach a significant level of effectiveness. The pricing signals will only cause mode shifts if alternative modes of travel are available and reliable.

Measure Applicability:

- Central business district or urban center only

Baseline Method:

See introduction to transportation section for a discussion of how to estimate trip rates and VMT. The CO_2 emissions are calculated from VMT as follows:

$$CO_2 = VMT \times EF_{running}$$

Where:

VMT = vehicle miles traveled

$EF_{running}$ = emission factor for running emissions

Inputs:

The following information needs to be provided by the Project Applicant:

- Percentage increase in pricing for passenger vehicles to cross cordon
- Peak period variable price or static all-day pricing (London scheme)

The following are optional inputs. Average (default) values are included in the calculations but can be updated to project-specific values if desired. Please see Appendix C for calculation detail:

- % (due to pricing) route shift, time-of-day shift, HOV shift, trip reduction, shift to transit/walk/bike

Mitigation Method:

% VMT Reduction = Cordon$ * B * C

Where

Cordon$	= % increase in pricing for passenger vehicles to cross cordon
B	= Elasticity of VMT with respect to price (from [1])
C	= Adjustment for % of VMT impacted by congestion pricing and mode shifts

Detail:

- Cordon$: reasonable range of 100 – 500% (See Appendix C for detail))
- B: 0.45 [1]
- C:

Cordon pricing scheme	Adjustment
Peak-period variable pricing	8.8%
Static all-day pricing	21%
Source: See Appendix C for detail	

Assumptions:

Data based upon the following references:

[1] Cambridge Systematics. *Moving Cooler: An Analysis of Transportation Strategies for Reducing Greenhouse Gas Emissions.* Technical Appendices. Prepared for the Urban Land Institute. (p. B-13, B-14) http://www.movingcooler.info/Library/Documents/Moving%20Cooler_Appendix%20B_Effectiveness_102209.pdf

- Referencing: VTPI, *Transportation Elasticities: How Prices and Other Factors Affect Travel Behavior.* July 2008. www.vtpi.org

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions[75]
CO_2e	7.9 - 22.0% of running
PM	7.9 - 22.0% of running
CO	7.9 - 22.0% of running
NOx	7.9 - 22.0% of running
SO_2	7.9 - 22.0% of running
ROG	4.7 – 13.2% of total

Discussion:

The amount of pricing will vary on a case-by-case basis. The 100 – 500% increase is an estimated range of increases and should be adjusted to reflect the specificities of the pricing scheme implemented. Take care in calculating the percentage increase in price if baseline is $0.00. An upper limit of 500% may be a good check point. If baseline is zero, the Project Applicant may want to conduct calculations with a low baseline such as $1.00.

These calculations assume that the project is within the area cordon, essentially assuming that 100% of project trips will be affected. See Appendix C to make appropriate adjustments.

Example:

Sample calculations are provided below:

- Low Range % VMT Reduction (100% increase in price, peak period pricing) = 100% * 0.45 * 8.8% = 4.0%
- High Range % VMT Reduction (500% increase in price, all-day pricing) = 500% * 0.45 * 21% = 47.3% = 22% (established maximum based on literature)

Preferred Literature:

- -0.45 VMT elasticity with regard to pricing
- 0.04-0.08% greenhouse gas (GHG) reduction

Moving Cooler [1] assumes an average of 3% of regional VMT would cross the CBD cordon. A VMT reduction of 20% was estimated to require an average of 65 cents/mile applied to all congested VMT in the CBD, major employment, and retail centers. The

[75] The percentage reduction reflects emission reductions from running emissions. The actual value will be less than this when starting and evaporative emissions are factored into the analysis. ROG emissions have been adjusted to reflect a ratio of 40% evaporative and 60% exhaust emissions based on a statewide EMFAC run of all vehicles.

range in GHG reductions is attributed to the range of implementation and start date. *Moving Cooler* reports an elasticity range from -0.15 to -0.47 from VTPI. *Moving Cooler* utilizes a stronger elasticity (0.45) to represent greater impact cordon pricing will have on users compared to other pricing strategies.

Alternative Literature:

- 6.5-14.0% reduction in carbon emissions
- 16-22% reduction in vehicles
- 6-9% increase in transit use

The Center for Clean Air Policy (CCAP) [2] cites two case studies in Europe, one in London and one in Stockholm, which show vehicle reductions of 16% and 22%, respectively. London's fee reduced CO_2 by 6.5%. Stockholm's program reduced injuries by 10%, increased transit use by 6-9%, and reduced carbon emissions by 14% in the central city within months of implementation.

Alternative Literature References:

[2] Center for Clean Air Policy (CCAP), *Short-term Efficiency Measures.* (p. 1) http://www.ccap.org/docs/resources/715/Short-Term%20Travel%20Efficiency%20Measures%20cut%20GHGs%209%2009%20final.pdf

Other Literature Reviewed:

None

3.6.2 Improve Traffic Flow

Range of Effectiveness: 0 - 45% reduction in GHG emissions

Measure Description:

The project will implement improvements to smooth traffic flow, reduce idling, eliminate bottlenecks, and management speed. Strategies may include signalization improvements to reduce delay, incident management to increase response time to breakdowns and collisions, Intelligent Transportation Systems (ITS) to provide real-time information regarding road conditions and directions, and speed management to reduce high free-flow speeds.

This measure does not take credit for any reduction in GHG emissions associated with changes to non-project traffic VMT. If Project Applicant wants to take credit for this benefit, the non-project traffic VMT would also need to be covered in the baseline conditions.

Measure Applicability:

- Urban, suburban, and rural context

Baseline Method:

See introduction to transportation section for a discussion of how to estimate trip rates and VMT. The CO_2 emissions are calculated from VMT as follows:

$$CO_2 = VMT \times EF_{running}$$

Where:

VMT = vehicle miles traveled

$EF_{running}$ = emission factor for running emissions

Inputs:

The following information needs to be provided by the Project Applicant:

- Average base-year travel speed (miles per hour (mph)) on implemented roads (congested[76] condition)

[76] A roadway is considered "congested" if operating at Level of Service (LOS) E or F

- Future travel speed (mph) on implemented roads for both a) congested and b) free-flow[77] condition
- Total vehicle miles traveled (VMT) on implemented roadways
- Total project-generated VMT

Mitigation Method:

$$\% \ CO_2 \text{ Emissions Reduction} = 1 - \frac{\text{Project GHG Emission}_{\text{post strategy}}}{\text{Project GHG emission}_{\text{baseline}}}$$

Where

Project GHG emission$_{\text{post strategy}}$ = EF_{running} after strategy implementation * project VMT
Project GHG emission$_{\text{baseline}}$ = EF_{running} before strategy implementation * project VMT
EF_{running} = emission factor for running emissions [from table presented under "Detail" below]

Detail:

mph	Grams of CO_2 / mile	
	congested	Free-flow
5	1,110	823
10	715	512
15	524	368
20	424	297
25	371	262
30	343	247
35	330	244

80	420	416
85	497	478
Source: Barth, 2008, Fehr & Peers [1]		

[77] A roadway is considered "free flow" if operating at LOS D or better

By only including the project VMT portion, the reduction is typically on scale with the percentage of cost for traffic improvements and full reduction calculated for project VMT should be used. However, if the project cost is a greater share than their contribution to the VMT on the road, than the project and non-project VMT should be calculated and the percent reduction should be multiplied by the percent cost allocation. The GHG emission reductions associated with non-project VMT (if applicable) would be calculated as follows:

Metric Tonnes GHG reduced due to improving non-Project traffic flow	=	% Cost Allocation * Non-Project VMT * ($EF_{congested}$ –$EF_{freeflow}$) / (1,000,000 gram/MT)

Where:

Non-Project VMT that the Project's cost share impacts = portion of non-project VMT

$EF_{congested}$ = emissions for congested road in g/VMT

$EF_{freeflow}$ = emissions for freeflow road in g/VMT

Assumptions:

Data based upon the following references:

[1] Barth and Boriboonsomsin, "Real World CO_2 Impacts of Traffic Congestion", *Transportation Research Record, Journal of the Transportation Research Board,* No. 2058, Transportation Research Board, National Academy of Science, 2008.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions[78]
CO_2e	0 - 45% of running
PM	0 - 45% of running
CO	0 - 45% of running

[78] The percentage reduction reflects emission reductions from running emissions. The actual value will be less than this when starting and evaporative emissions are factored into the analysis. ROG emissions have been adjusted to reflect a ratio of 40% evaporative and 60% exhaust emissions based on a statewide EMFAC run of all vehicles.

NOx	0 - 45% of running
SO_2	0 - 45% of running
ROG	0 - 27% of total

Discussion:

Care must be taken when estimating effectiveness since significantly improving traffic flow essentially lowers the cost and delay involved in travel, which under certain circumstances may induce additional VMT. [See Appendix C for a discussion on induced travel.]

The range of effectiveness presented above is a very rough estimate as emissions reductions will be highly dependent on the level of implementation and degree of congestion on the existing roadways. In addition, the low range of effectiveness was stated at 0% to highlight the potential of induced travel negating benefits achieved from this strategy.

Example:

Sample calculations are provided below:

- Signal timing coordination implementation:
  - Existing congested speeds of 25 mph
  - Conditions post-implementation: would improve to 25 mph free flow speed
  - Proposed project daily traffic generation is 200,000 VMT
  - Project CO_2 Emissions$_{baseline}$ = (371 g CO_2/mile) * (200,000 VMT daily) * (1 MT / 1 x 10^6 g) = 74 MT of CO_2 daily
  - Project CO_2 Emissions$_{post\ strategy}$ = (262 g CO_2/mile) * (200,000 VMT daily) * (1 MT / 1 x 10^6 g) = 52.4 MT of CO_2 daily
  - Percent CO_2emissions reduction = 1- (52.4 MT/ 74 MT) = 29%
- Speed management technique:
  - Existing free-flow speeds of 75 mph
  - Conditions post-implementation: reduce to 55 mph free flow speed
  - Proposed project daily traffic generation is 200,000 VMT
  - Project CO_2 Emissions$_{baseline}$ = (375 g CO_2/mile) * (200,000 VMT daily) * (1 MT / 1 x 10^6 g) = 75 MT of CO_2 daily
  - Project CO_2 Emissions$_{post\ strategy}$ = (289 g CO_2/mile) * (200,000 VMT daily) * (1 MT / 1 x 10^6 g) = 58 MT of CO_2 daily
  - Percent CO_2emissions reduction= 1 – (58 tons/ 75 tons) = 23%

Preferred Literature:

- 7 – 12% reduction in CO_2 emissions

This study [1] examined traffic conditions in Southern California using energy and emissions modeling and calculated the impacts of 1) congestion mitigation strategies to smooth traffic flow, 2) speed management techniques to reduce high free-flow speeds, and 3) suppression techniques to eliminate acceleration/deceleration associated with stop-and-go traffic. Using typical conditions on Southern California freeways, the strategies could reduce emissions by 7 to 12 percent.

The table (in the mitigation method section) was calculated using the CO_2 emissions equation from the report:

$$\ln(y) = b_0 + b_1 * x + b_2 * x^2 + b_3 * x^3 + b_4 * x^4$$

where

y = CO_2 emission in grams / mile
x = average trip speed in miles per hour (mph)

The coefficients for b_i were based off of Table 1 of the report, which then provides an equation for both congested conditions (real-world) and free-flow (steady-state) conditions.

Alternative Literature:

- 4 - 13% reduction in fuel consumption

The FHWA study [2] looks at various case studies of traffic flow improvements. In Los Angeles, a new traffic control signal system was estimated to reduce signal delays by 44%, vehicle stops by 41%, and fuel consumption by 13%. In Virginia, a study of retiming signal systems estimated reductions of stops by 25%, travel time by 10%, and fuel consumption by 4%. In California, optimization of 3,172 traffic signals through 1988 (through California's Fuel Efficient Traffic Signal Management program) documented an average reduction in vehicle stops of 16% and in fuel use of 8.6%. The 4-13% reduction in fuel consumption applies only to that vehicular travel directly benefited by the traffic flow improvements, specifically the VMT within the corridor in which the ITS is implemented and only during the times of day that would otherwise be congested without ITS. For example, signal coordination along an arterial normally congested in peak commute hours would produce a 4-13% reduction in fuel consumption only for the VMT occurring along that arterial during weekday commute hours.

Alternate:

- Up to 0.02% *increase* in greenhouse gas (GHG) emissions

Moving Cooler [3] estimates that bottleneck relief will result in an increase in GHG emissions during the 40-year period, 2010 to 2050. In the short term, however, improved roadway conditions may improve congestion and delay, and thus reduce fuel consumption. VMT and GHG emissions are projected to increase after 2030 as induced demand begins to consume the roadway capacity. The study estimates a maximum increase of 0.02% in GHG emissions.

3.6.3 Required Project Contributions to Transportation Infrastructure Improvement Projects

Range of Effectiveness: Grouped strategy. [See RPT-2 and TST-1 through 7]

Measure Description:

The project should contribute to traffic-flow improvements or other multi-modal infrastructure projects that reduce emissions and are not considered as substantially growth inducing. The local transportation agency should be consulted for specific needs.

Larger projects may be required to contribute a proportionate share to the development and/or continuation of a regional transit system. Contributions may consist of dedicated right-of-way, capital improvements, easements, etc. The local transportation agency should be consulted for specific needs.

Refer to Traffic Flow Improvements (RPT-2) or the Transit System Improvements (TST-1 through 7) strategies for a range of effectiveness in these categories. The benefits of Required Contributions may only be quantified when grouped with related improvements.

Measure Applicability:

- Urban, suburban, and rural context
- Appropriate for residential, retail, office, mixed use, and industrial projects

Alternative Literature:

Although no literature discusses project contributions as a standalone measure, this strategy is a supporting strategy for most operations and infrastructure projects listed in this report.

Other Literature Reviewed:

None

3.6.4 Install Park-and-Ride Lots

Range of Effectiveness: Grouped strategy. [See RPT-1, TRT-11, TRT-3, and TST-1 through 6]

Measure Description:

This project will install park-and-ride lots near transit stops and High Occupancy Vehicle (HOV) lanes. Park-and-ride lots also facilitate car- and vanpooling. Refer to Implement Area or Cordon Pricing (RPT-1), Employer-Sponsored Vanpool/Shuttle (TRT-11), Ride Share Program (TRT-3), or the Transit System Improvement strategies (TST-1 through 6) for ranges of effectiveness within these categories. The benefits of Park-and-Ride Lots are minimal as a stand-alone strategy and should be grouped with any or all of the above listed strategies to encourage carpooling, vanpooling, ride-sharing, and transit usage.

Measure Applicability:

- Suburban and rural context
- Appropriate for residential, retail, office, mixed use, and industrial projects

Alternative Literature:

Alternate:

- 0.1 – 0.5% vehicle miles traveled (VMT) reduction

A 2005 FHWA [1] study found that regional VMT in metropolitan areas may be reduced between 0.1 to 0.5% (citing Apogee Research, Inc., 1994). The reduction potential of this strategy may be limited because it reduces the trip length but not vehicle trips.

Alternate:

- 0.50% VMT reduction per day

Washington State Department of Transportation (WSDOT) [2] notes the above number applies to countywide interstates and arterials.

3.7 Vehicles

3.7.1 Electrify Loading Docks and/or Require Idling-Reduction Systems

Range of Effectiveness: 26-71% reduction in TRU idling GHG emissions

Measure Description:

Heavy-duty trucks transporting produce or other refrigerated goods will idle at truck loading docks and during layovers or rest periods so that the truck engine can continue to power the cab cooling elements. Idling requires fuel use and results in GHG emissions.

The Project Applicant should implement an enforcement and education program that will ensure compliance with this measure. This includes posting signs regarding idling restrictions as well as recording engine meter times upon entering and exiting the facility.

Measure Applicability:

- Truck refrigeration units (TRU)

Inputs:

The following information needs to be provided by the Project Applicant:

- Electricity provider for the Project
- Horsepower of TRU
- Hours of operation

Baseline Method:

$$\text{GHG emission} = \frac{CO_2\ \text{Exhaust}}{\text{Activity} \times \text{AvgHP} \times LF} \times Hp \times Hr \times C \times LF$$

Where:

GHG emission = MT CO_2e

CO_2 Exhaust = Statewide daily CO_2 emission from TRU for the relevant horsepower tier (tons/day). Obtained from OFFROAD2007.

Activity = Statewide daily average TRU operating hours for the relevant horsepower tier (hours/day). Obtained from OFFROAD2007.

AvgHP = Average TRU horsepower for the relevant horsepower tier (HP). Obtained from OFFROAD2007.

Hp = Horsepower of TRU.

Hr = Hours of operation.

C = Unit conversion factor

LF = Load factor of TRU for the relevant horsepower tier (dimensionless). Obtained from OFFROAD 2007.

Note that this method assumes the load factor of the TRU is same as the default in OFFROAD2007.

Mitigation Method:

Electrify loading docks

TRUs will be plugged into electric loading dock instead of left idling. The indirect GHG emission from electricity generation is:

$$\text{GHG emission} = \text{Utility} \times \text{Hp} \times \text{LF} \times \text{Hr} \times \text{C}$$

Where:

GHG emissions = MT CO_2e
Utility = Carbon intensity of Local Utility (CO_2e/kWh)
Hp = Horsepower of TRU.
LF = Load factor of TRU for the relevant horsepower tier (dimensionless). Obtained from OFFROAD2007.
Hr = Hours of operation.
C = Unit conversion factor

GHG Reduction %[79] $= 1 - \dfrac{\text{Utility} \times \text{C}}{\text{EF} \times 10^{-6}}$

Idling Reduction

Emissions from reduced TRU idling periods are calculated using the same methodology for the baseline scenario, but with the shorter hours of operation.

$$\text{GHG Reduction \%} = 1 - \frac{time_{mitigated}}{time_{baseline}}$$

Electrify loading docks

Power Utility	TRU Horsepower (HP)	Idling Emission Reductions[80]
LADW&P	< 15	26.3%
	< 25	26.3%
	< 50	35.8%

[79] This assumes energy from engine losses are the same.
[80] This reduction percentage applies to all GHG and criteria pollutant idling emissions.

PG&E	< 15	72.9%
	< 25	72.9%
	< 50	76.3%
SCE	< 15	61.8%
	< 25	61.8%
	< 50	66.7%
SDGE	< 15	53.5%
	< 25	53.5%
	< 50	59.5%
SMUD	< 15	67.0%
	< 25	67.0%
	< 50	71.2%

Idling Reduction

Emission reduction from shorter idling period is same as the percentage reduction in idling time.

Discussion:

The output from OFFROAD2007 shows the same emissions within each horsepower tier regardless of the year modeled. Therefore, the emission reduction is dependent on the location of the Project and horsepower of the TRU only.

Assumptions:

Data based upon the following references:

- California Air Resources Board. Off-road Emissions Inventory. OFFROAD2007. Available online at: http://www.arb.ca.gov/msei/offroad/offroad.htm
- California Climate Action Registry Reporting Online Tool. 2006 PUP Reports. Available online at: https://www.climateregistry.org/CARROT/public/reports.aspx

Preferred Literature:

The electrification of truck loading docks can allow properly equipped trucks to take advantage of external power and completely eliminate the need for idling. Trucks would need to be equipped with internal wiring, inverter, system, and a heating, ventilation, and air conditioning (HVAC) system. Under this mitigation measure, the direct emissions from fuel combustion are completely displaced by indirect emissions from the CO_2 generated during electricity production. The amount of electricity required depends on the type of truck and refrigeration elements; this data could be determined from manufacturer specifications. The total kilowatt-hours required should be multiplied by the carbon-intensity factor of the local utility provider in order to calculate the amount of indirect CO_2 emissions. To take credit for this mitigation measure, the Project Applicant would need to provide detailed evidence supporting a calculation of the emissions reductions.

3.7.2 Utilize Alternative Fueled Vehicles

Range of Effectiveness: Reduction in GHG emissions varies depending on vehicle type, year, and associated fuel economy.

Measure Description:

When construction equipment is powered by alternative fuels such as biodiesel (B20), liquefied natural gas (LNG), or compressed natural gas (CNG) rather than conventional petroleum diesel or gasoline, GHG emissions from fuel combustion may be reduced.

Measure Applicability:

- Vehicles

Inputs:

The following information needs to be provided by the Project Applicant:

- Vehicle category
- Traveling speed (mph)
- Number of trips and trip length, or Vehicle Miles Traveled (VMT)
- Fuel economy (mpg) or Fuel consumption

Baseline Method:

$$\text{Baseline } CO_2 \text{ Emission} = EF \times \frac{1}{FE} \times VMT \times C$$

Where:

Baseline CO_2 Emission	=	MT of CO_2
EF	=	CO_2 emission factor, from CCAR General Reporting Protocol (g/gallon)
VMT	=	Vehicle miles traveled (VMT) = T x L
FE	=	Fuel economy (mpg)
C	=	Unit conversion factor

$$\text{Baseline } N_2O / CH_4 \text{ Emission} = EF \times VMT \times C$$

Where:

Baseline N_2O/CH_4 Emission	=	MT of N_2O or CH_4
EF	=	N_2O or CH_4 emission factor, from CCAR General Reporting Protocol (g/mile)
VMT	=	Vehicle miles traveled (VMT) = T x L
T	=	Number of one-way trips
L	=	One-way trip length
FC	=	Fuel consumption (gallon) = VMT/FE

FE = Fuel economy (mpg)
C = Unit conversion factor

The total baseline GHG emission is the sum of the emissions of CO_2, N_2O and CH_4, adjusted by their global warming potentials (GWP):

Baseline GHG Emission
= Baseline CO_2 Emission + Baseline N_2O Emission $\times$ 310 +Baseline CH_4 Emission $\times$ 21

Where:

Baseline GHG Emission = MT of CO_2e
310 = GWP of N_2O
21 = GWP of CH_4

Mitigation Method:

Mitigated emissions from using alternative fuel is calculated using the same methodology before, but using emission factors for the alternative fuel, and fuel consumption calculated as follows:

$$GHGemissions = \frac{1}{FE} \times ER \times VMT \times EF_{CO2} + VMT \times EF_{N20} + VMT \times EF_{CH4}$$

Where:

ER = Energy ratio from US Department of Energy (see table below)
EF = Emission Factor for pollutant
VMT = Vehicle miles traveled (VMT)
FE = Fuel economy (mpg)

Fuel	Energy Ratio: Amount of fuel needed to provide same energy as			
	1 gallon of Gasoline		1 gallon of Diesel	
Gasoline	1	gal	1.13	gal
#2 Diesel	0.88	gal	1	gal
B20	0.92	gal	1.01	gal
CNG	126.67	ft^3	143.14	ft^3
LNG	1.56	gal	1.77	gal
LPC	1.37	gal	1.55	gal

Emission reductions can be calculated as:

$$\text{Reduction} = 1 - \frac{\text{Mitigated Emission}}{\text{Running Emission}}$$

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	Range Not Quantified[81]
PM	Range Not Quantified
CO	Range Not Quantified
NOx	Range Not Quantified
SO_2	Range Not Quantified
ROG	Range Not Quantified

Discussion:

Using the methodology described above, only the running emission is considered. A hypothetical scenario for a gasoline fueled light duty automobile in 2015 is illustrated below. The CO_2 emission factor from motor gasoline in CCAR 2009 is 8.81 kg/gallon. Assuming the automobile makes two trips of 60 mile each per day, and using the current passenger car fuel economy of 27.5 mpg under the CAFE standards, then the annual baseline CO_2 emission from the automobile is:

$$8.81 \times \frac{2 \times 60 \times 365}{27.5} \times 10^{-3} = 14.0 \text{ MT/year}$$

Where 10^{-3} is the conversion factor from kilograms to MT.

Using the most recent N_2O emission factor of 0.0079 g/mile in CCAR 2009 for gasoline passenger cars, the annual baseline N_2O emission from the automobile is:

$$0.0079 \times 2 \times 365 \times 60 \times 10^{-6} = 0.000346 \text{ MT/year}$$

[81] The emissions reductions varies and depends on vehicle type, year, and the associated fuel economy. The methodology above describes how to calculate the expected GHG emissions reduction assuming the required input parameters are known.

Similarly, using the same formula with the most recent CH_4 emission factor of 0.0147 g/mile in CCAR 2009 for gasoline passenger cars, the annual baseline CH_4 emission from the automobile is calculated to be 0.000644 MT/year.

Thus, the total baseline GHG emission for the automobile is:

$$14.0 + 0.000346 \times 310 + 0.000644 \times 21 = 14.1 \text{ MT/year}$$

If compressed natural gas (CNG) is used as alternative fuel, the CNG consumption for the same VMT is:

$$\frac{2 \times 60 \times 365}{27.5} \times 126.67 = 201{,}751 \text{ ft}^3$$

Using the same formula as for the baseline scenario but with emission factors of CNG and the CNG consumption, the mitigated GHG emission can be calculated as shown in the table below

Pollutant	Emission (MT/yr)
CO_2	11.0
N_2O	0.0022
CH_4	0.0323
CO_2e	12.4

Therefore, the emission reduction is:

$$1 - \frac{12.4}{14.0} = 11.4\%$$

Notice that in the baseline scenario, N_2O and CH_4 only make up <1% of the total GHG emissions, but actually increase for the mitigated scenario and contribute to >10% of total GHG emissions.

Assumptions:

Data based upon the following references:

- California Climate Action Registry (CCAR). 2009. General Reporting Protocol. Version 3.1. Available online at: http://www.climateregistry.org/tools/protocols/general-reporting-protocol.html

- US Department of Energy. 2010. Alternative and Advanced Fuels – Fuel Properties. Available online at: http://www.afdc.energy.gov/afdc/fuels/properties.html

Preferred Literature:

The amount of emissions avoided from using alternative fuel vehicles can be calculated using emission factors from the California Climate Action Registry (CCAR) General Reporting Protocol [1]. Multiplying this factor by the fuel consumption or vehicle miles traveled (VMT) gives the direct emissions of CO_2 and N_2O /CH_4, respectively. Fuel consumption and VMT can be calculated interchangeably with the fuel economy (mpg). The total GHG emission is the sum of the emissions from the three chemicals multiplied by their respective global warming potential (GWP).

Assuming the same VMT, the amount of alternative fuel required to run the same vehicle fleet can be calculated by multiplying gasoline/diesel fuel consumption by the equivalent-energy ratio obtained from the US Department of Energy [2]. Using the alternative fuel consumption and the emission factors for the alternative fuel from CCAR, the mitigated GHG emissions can be calculated. The GHG emissions reduction associated with this mitigation measure is therefore the difference in emissions from these two scenarios.

Alternative Literature:

None

3.7.3 Utilize Electric or Hybrid Vehicles

Range of Effectiveness: 0.4 - 20.3% reduction in GHG emissions

Measure Description:

When vehicles are powered by grid electricity rather than fossil fuel, direct GHG emissions from fuel combustion are replaced with indirect GHG emissions associated with the electricity used to power the vehicles. When vehicles are powered by hybrid-electric drives, GHG emissions from fuel combustion are reduced.

Measure Applicability:

- Vehicles

Inputs:

The following information needs to be provided by the Project Applicant:

- Vehicle category
- Traveling speed (mph)
- Number of trips and trip length, or Vehicle Miles Traveled (VMT)
- Fuel economy (mpg)

Baseline Method:

$$\text{Baseline Emission} = EF \times (1 - R) \times VMT \times C$$

Where:

Baseline Emission	=	MT of Pollutant
EF	=	Running emission factor for pollutant at traveling speed, from EMFAC.
VMT	=	Vehicle miles traveled (VMT)
R	=	Additional reduction in EF due to regulation (see Table 1)
C	=	Unit conversion factor

Mitigation Method:

<u>Fully Electric Vehicle</u>

Vehicle will run solely on electricity. The indirect GHG emission from electricity generation is:

$$\text{Mitigated Emission} = \text{Utility} \times \frac{1}{FE} \times VMT \times ER \times C$$

Where:

Mitigated Emission = MT of CO_2e
Utility = Carbon intensity of Local Utility (CO_2e/kWh)
VMT = Vehicle miles traveled (VMT)
ER = Energy Ratio = 33.4 kWh/gallon-gasoline or 37.7 kWh/gallon-diesel
FE = Fuel Economy (mpg)
C = Unit conversion factor

Power Utility	Carbon-Intensity (lbs CO_2e/MWh)
LADW&P	1,238
PG&E	456
SCE	641
SDGE	781
SMUD	555

Criteria pollutant emissions will be 100% reduced for equipment running solely on electricity.

Hybrid-Electric Vehicle

The Project Applicant has to determine the fuel consumption reduced from using the hybrid-electric vehicle. The emission reductions for all pollutants are the same as the fuel reduction.

Emission reductions can be calculated as:

$$\text{GHG Reduction\%} = 1 - \frac{\text{Mitigated Emission}}{\text{Running Emission}}$$

Emission Reduction Ranges and Variables:

See Table VT-3.1 below.

Discussion:

Using the methodology described above, only the running emission is considered. A hypothetical scenario for a gasoline fueled light duty automobile with catalytic converter in 2015 is illustrated below. The running CO_2 emission factor at 30 mph from an EMFAC run of the Sacramento county with temperature of 60F and relative humidity of 45% is 336.1 g/mile. From Table VT-3.1, there will be an additional reduction of 9.1% for the emission factor in 2015 due to Pavley standard. Assuming the automobile makes two trips of 60 mile each per day, then annual baseline emission from the automobile is:

$$336.1\times(100\% - 9.1\%)\times 2\times 365\times 60\times 10^{-6} = 13.4 \text{ MT/year}$$

Where 10^{-6} is the conversion factor from grams to MT. Assuming the current passenger car fuel economy of 27.5 mpg under the CAFE standards, and using the carbon-intensity factor for PG&E, the electric provider for the Sacramento region, the mitigated emission from replacing the automobile described above with electric vehicle would be:

$$\left(456\times\frac{2\times 365\times 60}{27.5}\times 33.4\times\frac{1}{2{,}204\times 10^{3}}\right) = 11.0 \text{ MT/year}$$

Therefore, the emission reduction is:

$$1-\frac{11.0}{13.4} = 17.9\%$$

Assumptions:

Data based upon the following references:

- California Air Resources Board. EMFAC2007. Available online at: http://www.arb.ca.gov/msei/onroad/latest_version.htm
- California Climate Action Registry (CCAR). 2009. General Reporting Protocol. Version 3.1. Available online at: http://www.climateregistry.org/tools/protocols/general-reporting-protocol.html
- California Climate Action Registry Reporting Online Tool. 2006 PUP Reports. Available online at: https://www.climateregistry.org/CARROT/public/reports.aspx
- US Department of Energy. 2010. Alternative and Advanced Fuels – Fuel Properties. Available online at: http://www.afdc.energy.gov/afdc/fuels/properties.html

Preferred Literature:

The amount of emissions avoided from using electric and hybrid vehicles can be calculated using CARB's EMFAC model, which provides state-wide and regional running emission factors for a variety of on-road vehicles in units of grams per mile [1]. Multiplying this factor by the vehicle miles traveled (VMT) gives the direct emissions. For criteria pollutant, emissions can be assumed to be 100% reduced from running on electricity. For GHG, assuming the same VMT, the electricity required to run the same vehicle fleet can be calculated by dividing by the fuel economy (mph) and multiplying the gasoline-electric energy ratio obtained from the US Department of Energy [2]. Multiplying this value by the carbon-intensity factor of the local utility gives the amount of indirect GHG emissions associated with electric vehicles. The GHG emissions reduction associated with this mitigation measure is therefore the difference in emissions from these two scenarios.

4.0 Water

4.1 Water Supply

4.1.1 Use Reclaimed Water

Range of Effectiveness: Up to 40% in Northern California and up to 81% in Southern California

Measure Description:

California water supplies come from ground water, surface water, and from reservoirs, typically fed from snow melt. Some sources of water are transported over long distances, and sometimes over terrain to reach the point of consumption. Transporting water can require a significant amount of electricity. In addition, treating water to potable standards can also require substantial amounts of energy. Reclaimed water is water reused after wastewater treatment for non-potable uses instead of returning the water to the environment. This is different than gray water, which has not been through wastewater treatment. Reclaimed non-potable water requires significantly less energy to collect, treat, and redistribute water to the point of local areas of non-potable water consumption. Since less energy is required to provide reclaimed water, fewer GHGs will be associated with reclaimed water use compared to the average California water supply use.

This measure describes how to calculate GHG savings from using reclaimed water instead of new potable water supplies for outdoor water uses or other non-potable water uses. The baseline scenario document outlines average Northern and Southern California electricity-use water factors, and assumes that all water is treated to potable standards.

Measure Applicability:

- Non-potable water use

Inputs:

The following information needs to be provided by the Project Applicant:

- Reclaimed water use (million gallons)
- Total non-potable water use (million gallons)

Baseline Method:

$$\text{GHG emissions} = \text{Water}_{\text{non-potable total}} \times \text{Electricity}_{\text{baseline}} \times \text{Utility}$$

Where:

GHG emissions = MT CO_2e
$Water_{non\text{-}potable\ total}$ = Total volume of non-potable water used (million gallons)
Provided by Applicant
$Electricity_{baseline}$ = Electricity required to supply, treat, and distribute water (kWh/million gallons)
Northern California Average: 3,500 kWh/million gallons
Southern California Average: 11,111 kWh/million gallons
Utility = Carbon intensity of Local Utility (CO_2e/kWh)

Mitigation Method:

A million gallons of reclaimed water would use an average of 2,100 kWh electricity per million gallons of water (range of 1,200 to 3,000 kWh). Therefore the percent reduction in GHG emissions associated with implementing reclaimed water usage is:

$$\text{GHG emission reduction} = \frac{Water_{reclaimed}}{Water_{non\text{-}potable\ total}} \times \frac{Electricity_{baseline} - Electricity_{reclaimed}}{Electricity_{baseline}}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions for non-potable water use.
$Water_{reclaimed}$ = Total volume of reclaimed water used (million gallons)
Provided by Applicant
$Water_{non\text{-}potable\ total}$ = Total volume of non-potable water used (million gallons)
Provided by Applicant
$Electricity_{reclaimed}$ = Electricity required to treat and distribute reclaimed water (2,100 kWh/million gallons)
$Electricity_{baseline}$ = Electricity required to supply and distribute water
Northern California Average: 3,500 kWh/million gallons
Southern California Average: 11,111 kWh/million gallons

Therefore, for projects in Northern California, the reduction in GHG emissions is:

$$\text{GHG emission reduction} = \frac{Water_{reclaimed}}{Water_{non\text{-}potable\ total}} \times \frac{(3{,}500 - 2{,}100)}{3{,}500} = \frac{Water_{reclaimed}}{Water_{non\text{-}potable\ total}} \times 0.40$$

And for projects in Southern California, the reduction in GHG emissions is:

$$\text{GHG emission reduction} = \frac{Water_{reclaimed}}{Water_{non\text{-}potable\ total}} \times \frac{(11{,}111 - 2{,}100)}{11{,}111} = \frac{Water_{reclaimed}}{Water_{non\text{-}potable\ total}} \times 0.81$$

As shown in these equations, the carbon intensity of the local utility does not play a role in determining the percentage reduction in GHG emissions.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	N. California: Up to 40% if assuming 100% reclaimed water S. California: Up to 81% if assuming 100% reclaimed water Percent reduction would scale down linearly as the percent reclaimed water decreases.
All other pollutants	Not quantified[82]

Discussion:

If the Project Applicant uses 100 million gallons of non-potable water for a project in Northern California, they would calculate baseline emissions as described in the baseline methodologies document. If the applicant then selects to mitigate water by committing to using 40 million gallons of reclaimed water in place of the usual water source, the applicant would reduce the amount of GHG emissions associated with outdoor water use by 16%

$$\text{GHG Emission Reduced} = \frac{40}{100} \times 0.40 = 0.16 \text{ or } 16\%$$

Assumptions:

Data based upon the following reference:

[1] CEC. 2006. Refining Estimates of Water-Related Energy Use in California. PIER Final Project Report. Prepared by Navigant Consulting, Inc. CEC-500-2006-118. Available online at: http://www.energy.ca.gov/2006publications/CEC-500-2006-118/CEC-500-2006-118.PDF

Preferred Literature:

GHG emissions from the mitigated scenario should be calculated based on the 2006 CEC report, which presents regional baseline electricity-use water factors and a factor of 1,200-3,000 kWh per million gallons for reclaimed water. GHG emissions are calculated by multiplying the amount of water (million gallons) by the electricity-use water factor (kWh per million gallons) by the carbon-intensity of the local utility (CO_2e per kWh). The GHG emissions reductions associated with this mitigation measure are

[82] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

associated with the difference between the baseline potable water electricity-use water factor and the mitigated scenario.

4.1.2 Use Gray Water

Range of Effectiveness: Up to 100% of outdoor water GHG emissions if outdoor water use is replaced completely with graywater

Measure Description:

California water supplies come from ground water, surface water, and from reservoirs, typically fed from snow melt. Some sources of water are transported over long distances, and sometimes over terrain to reach the point of consumption. Transporting water can require a significant amount of electricity. In addition, treating water to potable standards can also require substantial amounts of energy. Untreated wastewater generated from bathtubs, showers, bathroom wash basins, and clothes washing machines is known as graywater and is collected and distributed onsite for irrigation of landscape and mulch. Since graywater does not require treatment or energy to redistribute it onsite, there are negligible GHG emissions associated with the use of graywater.

This measure describes how to calculate GHG savings from using graywater instead of new potable water supplies for landscape irrigation and other outdoor uses. The baseline scenario document outlines average Northern and Southern California electricity-use water factors, and assumes that all water is non-potable.

Measure Applicability:

- Outdoor water use

Inputs:

The following information needs to be provided by the Project Applicant:

- Graywater use[83] (million gallons), or:
  - Type of graywater system, which must be compliant with the California Plumbing Code, and
  - Number of residents in homes with compliant graywater systems
- Total outdoor water use (million gallons)

Baseline Method:

$$\text{GHG emissions} = \text{Water}_{\text{outdoor total}} \times \text{Electricity}_{\text{baseline}} \times \text{Utility}$$

---

[83] Note that this is the amount of graywater used, which may be less than the amount of graywater generated. A project may generate and collect more graywater than is needed for landscape irrigation. The Project Applicant should only take credit for the amount of potable water which is displaced by graywater. The amount of landscape irrigation water demand (graywater demand) is calculated according to the methodology described in WUW-3 and the baseline methodologies document.

Where:

GHG emissions = MT CO_2e
$Water_{outdoor\ total}$ = Total volume of outdoor water used (million gallons)
Provided by Applicant
$Electricity_{baseline}$ = Electricity required to supply, treat, and distribute water (kWh/million gallons)
Northern California Average: 3,500 kWh/million gallons
Southern California Average: 11,111 kWh/million gallons
Utility = Carbon intensity of Local Utility (CO_2e/kWh)

Mitigation Method:

If the Project Applicant cannot provide the total amount of graywater used, the graywater use can be calculated based on the following equation:

$Water_{graywater}$ =

$$\left[\left(25 \times Residents_{graywater-sbw}\right) + \left(15 \times Residents_{graywater-laundry}\right)\right] \frac{gallons}{day} \times \frac{365\ days}{year} \times \frac{1\ million\ gallons}{10^6\ gallons}$$

Where:

$Water_{graywater}$ = Total volume of graywater used (million gallons).
$Residents_{graywater-sbw}$ = Total number of residents in homes with graywater systems based on graywater generated from showers, bathtubs, and wash basins
25 = gallons per day per residential occupant from showers, bathtubs, and washbasins [1]
$Residents_{graywater-laundry}$ = Total number of residents in homes with graywater systems based on graywater generated from laundry machines
15 = gallons per day per residential occupant from laundry machines [1]

The percent reduction in GHG emissions associated with implementing graywater usage is therefore:

$$\text{GHG emission reduction} = \frac{Water_{graywater}}{Water_{oudoor\ total}} \times \frac{Electricity_{baseline} - Electricity_{graywater}}{Electricity_{baseline}}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions for outdoor water use.
$Water_{graywater}$ = Total volume of graywater used (million gallons)
Provided by Applicant or calculated using equation above
$Water_{outdoor\ total}$ = Total volume of outdoor water used (million gallons)
Provided by Applicant

$Electricity_{graywater}$ = Electricity required to distribute graywater (0 kWh/million gallons)[84]
$Electricity_{baseline}$ = Electricity required to supply, treat, and distribute water
Northern California Average: 3,500 kWh/million gallons [2]
Southern California Average: 11,111 kWh/million gallons [2]

Therefore, for projects in Northern California, the reduction in GHG emissions is:

$$\text{GHG emission reduction} = \frac{Water_{graywater}}{Water_{outdoor\ total}} \times \frac{(3{,}500 - 0)}{3{,}500} = \frac{Water_{graywater}}{Water_{outdoor\ total}}$$

And for projects in Southern California, the reduction in GHG emissions is:

$$\text{GHG emission reduction} = \frac{Water_{graywater}}{Water_{outdoor\ total}} \times \frac{(11{,}111 - 0)}{11{,}111} = \frac{Water_{graywater}}{Water_{outdoor\ total}}$$

As shown in these equations, the carbon intensity of the local utility does not play a role in determining the percentage reduction in GHG emissions.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	N. California: Up to 100% if assuming 100% graywater S. California: Up to 100% if assuming 100% graywater Percent reduction would scale down linearly as the percent reclaimed water decreases.
All other pollutants	Not Quantified[85]

Discussion:

If the Project Applicant uses 100 million gallons of water for outdoor uses in a project in Northern California, they would calculate baseline emissions as described above and in the baseline methodologies document. If the Project Applicant then selects to mitigate water by committing to establishing graywater systems based on graywater recovery from laundry machines in 500 homes with an average of 3 people in each home, the amount of graywater used is then:

[84] In some cases the distribution of graywater will require some amount of electricity; for example, graywater generated at residences and pumped to a nearby park. In those cases, $Electricity_{graywater}$ will be non-zero.
[85] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

$Water_{graywater}$ =

$$[(25\times 0)+(15\times 500\times 3)]\frac{\text{gallons}}{\text{day}}\times\frac{365\,\text{days}}{\text{year}}\times\frac{1\,\text{million gallons}}{10^6\ \text{gallons}} = 8.2 \text{ million gallons}$$

Then the Project Applicant would reduce the amount of GHG emissions associated with outdoor water use by 8.2%

$$\text{GHG Emission Reduced} = \frac{8.2}{100} = 0.082 \text{ or } 8.2\%$$

Assumptions:

Data based upon the following references:

[1] 2007 CPC, Title 24, Part 5, Chapter 16A, Part I – Nonpotable Water Reuse Systems. Available online at: http://www.hcd.ca.gov/codes/shl/2007CPC_Graywater_Complete_2-2-10.pdf

[2] CEC. 2006. Refining Estimates of Water-Related Energy Use in California. PIER Final Project Report. Prepared by Navigant Consulting, Inc. CEC-500-2006-118. December. Available online at: http://www.energy.ca.gov/2006publications/CEC-500-2006-118/CEC-500-2006-118.PDF

Preferred Literature:

Assuming a compliant graywater system is installed, Part 1606A.0 of the California Plumbing Code (CPC) estimates 25 gallons per day per residential occupant of graywater generation from showers, bathtubs, and wash basins, and 15 gallons per day per residential occupant of graywater discharge from laundry machines. Electricity and CO_2 savings from using graywater are determined by comparing to the emissions that would have been associated with the water use if the graywater demand had instead been supplied by potable water. The baseline emissions should be calculated based on the 2006 CEC methodology. A development may generate and collect more graywater than is needed for landscape irrigation. A Project Applicant should only take credit for emissions reductions associated with the amount of potable water which is displaced by graywater. The amount of landscape irrigation water demand (graywater demand) is calculated according to the methodology described in the baseline methodologies document and WUW-3.

4.1.3 Use Locally Sourced Water Supply

Range of Effectiveness: 0 – 60% for Northern and Central California, 11 – 75% for Southern California

Measure Description:

California water supplies come from ground water, surface water, and from reservoirs, typically fed from snow melt. Some sources of water are transported over long distances, and sometimes over terrain to reach the point of consumption. Transporting water can require a significant amount of electricity. Using locally-sourced water or water from less energy-intensive sources reduces the electricity and indirect CO_2 emissions associated with water supply and transport.

This measure describes how to calculate GHG savings from using local or less energy-intensive water sources instead of water from the typical mix of Northern and Southern California sources. According to the 2006 CEC report [1], water in Northern California (which also includes the Central Coast and San Joaquin Valley for this study) is primarily supplied by deliveries from the State Water Project and groundwater, and to a lesser extent is supplied by the gravity-dominated systems of Hetch Hetchy and the Mokelumne Aqueduct. In contrast, water imported from the State Water Project is Southern California's dominant water source. The baseline scenario uses average Northern and Southern California electricity intensity factors as reported in 2006 CEC and detailed in the Baseline Method below.

Measure Applicability:

- Indoor (potable) and outdoor (non-potable) water use

Inputs:

- Total potable and non-potable water use (million gallons)

Baseline Method:

$$\text{GHG emissions} = \text{Water}_{baseline} \times \text{Electricity}_{baseline} \times \text{Utility}$$

Where:

GHG emissions = MT CO_2e

$\text{Water}_{baseline}$ = Total volume of water used (million gallons)
Provided by Applicant

$\text{Electricity}_{baseline}$ = Electricity required to supply, treat, and distribute water (and for indoor uses, the electricity required to treat the resulting wastewater) (kWh/million gallons)
Indoor Uses:
Northern California Average: 5,411 kWh/million gallons [1]
Southern California Average: 13,022 kWh/million gallons [1]

Outdoor Uses:

Northern California Average: 3,500 kWh/million gallons [1]

Southern California Average: 11,111 kWh/million gallons [1]

Utility = Carbon intensity of Local Utility (CO_2e/kWh)

Mitigation Method:

Table WSW-3.1 shows that water from local or nearby groundwater basins, nearby surface water, and gravity-dominated systems have smaller energy-intensity factors than the average Northern and Southern California energy-intensity factors. The Project Applicant should use Table WSW-3.1 to identify the outdoor and indoor electricity intensity factors associated with the Project's water source(s). The GHG emission reduction is then calculated as follows:

$$\text{GHG emission reduction} = \frac{\text{Water}_{\text{mitigated}}}{\text{Water}_{\text{baseline}}} \times \frac{\text{Electricity}_{\text{baseline}} - \text{Electricity}_{\text{mitigated}}}{\text{Electricity}_{\text{baseline}}}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions for water use

$\text{Water}_{\text{mitigated}}$ = Volume of water to be supplied from the mitigated (local or less energy-intensive) source

Provided by Applicant

$\text{Water}_{\text{baseline}}$ = Total volume of water used (million gallons)

Provided by Applicant

$\text{Electricity}_{\text{mitigated}}$ = Electricity required to distribute water for Project from mitigated (local or less-energy intensive) source

$\text{Electricity}_{\text{baseline}}$ = Baseline electricity required to supply, treat, and distribute water (and for indoor uses, the electricity required to treat the resulting wastewater) (kWh/million gallons)

Indoor Uses:

Northern California Average: 5,411 kWh/million gallons [1]

Southern California Average: 13,022 kWh/million gallons [1]

Outdoor Uses:

Northern California Average: 3,500 kWh/million gallons [1]

Southern California Average: 11,111 kWh/million gallons [1]

As shown in these equations, the carbon intensity of the local utility does not play a role in determining the percentage reduction in GHG emissions.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	Assuming 100% of water is sourced locally: Indoor Uses: • 0-40% reduction for Northern and Central California • 11-64% reduction for Southern California Outdoor Uses: • 0-60% reduction for Northern and Central California • 12-75% reduction for Southern California
All other pollutants	Not Quantified[86]

Discussion:

Assume a Project is located in Southern California within the Chino Basin and has a total indoor water demand of 100 million gallons. Assume 70 million gallons will be sourced from a water district which obtains its water from the typical Southern California water sources. Therefore, for these 70 million gallons the baseline outdoor water electricity-intensity factor for Southern California is used. Assume that the Project Applicant chooses to mitigate the Project by sourcing the remaining 30 million gallons from the Chino Basin. The expected GHG emission reduction is then:

$$\text{GHG Emission Reduced} = \frac{30}{100} \times \frac{11{,}111 - 4{,}298}{11{,}111} = 0.18 \text{ or } 18\%$$

Assumptions:

Data based upon the following reference:

[1] CEC. 2006. Refining Estimates of Water-Related Energy Use in California. PIER Final Project Report. Prepared by Navigant Consulting, Inc. CEC-500-2006-118. December. Available online at: http://www.energy.ca.gov/2006publications/CEC-500-2006-118/CEC-500-2006-118.PDF

86 Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

[2]CEC. 2005. California's Water-Energy Relationship. Final Staff Report. CEC 700-2005-011-SF. Available online at: http://www.energy.ca.gov/2005publications/CEC-700-2005-011/CEC-700-2005-011-SF.PDF

[3]NRDC. 2004. Energy Down the Drain: The Hidden Costs of California's Water Supply. Prepared by NRDC and the Pacific Institute. Available online at: http://www.nrdc.org/water/conservation/edrain/edrain.pdf

Preferred Literature:

Electricity and CO_2 savings from using locally-sourced water or water from sources which require below-average electricity intensities for supply and conveyance (such as gravity-dominated systems or local groundwater basins that are not very deep) are determined by comparing to the emissions that would have occurred if the water had instead been conveyed from typical water sources for the region. According to the 2005 and 2006 CEC reports [1,2], the typical mix of water sources in Northern and Central California is the State Water Project, groundwater, and gravity-dominated systems such as Hetch Hetchy and the Mokelumne Aqueduct. The majority of water in Southern California is supplied by imports from the State Water Project and the Colorado River Aqueduct. Examples of mitigated electricity-intensity factors are shown in Table WSW-3.1 and are based on data provided in 2006 CEC [1], 2005 CEC [2], and 2004 NRDC [3]. GHG emissions are calculated by multiplying the amount of water (million gallons) by the electricity-use water factor (kWh per million gallons) by the carbon-intensity of the local utility (CO_2e per kWh). The GHG emissions reductions associated with this mitigation measure are associated with the difference between the baseline water electricity-intensity factor and the mitigated electricity-intensity factor.

4.2 Water Use

4.2.1 Install Low-Flow Water Fixtures

Range of Effectiveness: 20% of GHG emissions associated with indoor Residential water use; 17-31% of GHG emissions associated with Non-Residential indoor water use.

Measure Description:

Water use contributes to GHG emissions indirectly, via the production of the electricity that is used to pump, treat, and distribute the water. Installing low-flow or high-efficiency water fixtures in buildings reduces water demand, energy demand, and associated indirect GHG emissions.

This measure describes how to calculate GHG savings from installing low-flow water toilets, urinals, showerheads, or faucets, or high-efficiency clothes washers and dishwashers in residential and commercial buildings. To take credit for this mitigation measure, the Project Applicant must know the total expected indoor water demand before and after installation of low-flow or high-efficiency water fixtures. If expected water demand after implementation of the mitigation measure is not known, it can be calculated based on the information provided below. Water flow rates presented here in Tables WUW-1.1 and WUW-1.3 are based on technical specifications in the California Code of Regulations Title 20 (Appliance Efficiency Regulations) [2], Title 24 (California Green Building Standards Code) [1] and ENERGY STAR [5-8]. Indoor water end-uses for residential and commercial buildings presented here in Tables WUW-1.1 and WUW-1.2 are based on data provided in a 2003 report by the Pacific Institute for Studies in Development, Environment, and Security [3]. This report incorporates data from the most comprehensive end-use survey available to date, the 1999 Residential End Uses of Water survey published by the American Water Works Association [4], as well as California-specific population, water, and appliance data. California-specific data includes local utility water use and market penetration rates of low-flow and high-efficiency water fixtures.

The baseline scenario document describes the method to calculate baseline GHG emissions. It provides average Northern and Southern California electricity-use water factors and assumes that all water is treated to potable standards.

The percent reduction in GHG emissions is calculated based on the baseline scenario water use and the percent reduction in indoor water use achieved from a Project Applicant's commitment to installing low-flow and high-efficiency water fixtures. Table WUW-1.4 lists the estimated percent reductions in GHG emissions by water fixture and land use. The sum of all percent reductions applicable to the Project gives the overall percent reduction in GHG emissions expected from this mitigation measure. The details of these calculations are described below.

Measure Applicability:

- Indoor water use
- To meet CEQA enforcement requirements, the Project Applicant should only take credit for this mitigation measure if the clothes washers and dishwashers are supplied by the Project Applicant/builder.

Inputs:

The following information needs to be provided by the Project Applicant:

- Total expected indoor water demand, without installation of low-flow or high-efficiency fixtures (million gallons), AND
- Total expected indoor water demand, after installation of low-flow or high-efficiency fixtures (million gallons), OR
- Commitment to low-flow or high-efficiency water fixtures (toilets, showerheads, sink faucets, dishwashers, clothes washers, or all of the above)

Baseline Method:

$$\text{GHG emissions} = \text{Water}_{\text{baseline}} \times \text{Electricity} \times \text{Utility}$$

Where:

GHG emissions = MT CO_2e

$\text{Water}_{\text{baseline}}$ = Total expected indoor water demand, without installation of low-flow and high-efficiency fixtures (million gallons)
Provided by Applicant

Electricity = Electricity required to supply, treat, and distribute water and the resulting wastewater (kWh/million gallons)
Northern California Average: 5,411 kWh/million gallons
Southern California Average: 13,022 kWh/million gallons

Utility = Carbon intensity of Local Utility (CO_2e/kWh)

Mitigation Method:

Since this mitigation method does not change the electricity intensity factor (kWh/million gallons) associated with the supply, treatment, and distribution of the water, the percent reduction in GHG emissions is dependent only on the change in water consumption.

The Project Applicant can choose to compute the percent reduction in GHG emissions in one of three ways:

Method A

The Project Applicant can use Table WUW-1.4 to calculate the overall percent reduction in GHG emissions from committing to installing certain low-flow or high-efficiency water fixtures. The Project Applicant may commit to installing fixtures based on three standards: the California Green Building Standards Code (CGBSC) mandatory requirements, the CGBSC voluntary standards, or the ENERGY STAR standards. Table WUW-1.4 presents the percent reductions in GHG emissions for each of these three standards based on water fixture type (toilet, showerhead, clothes washer, etc) and land use type (residential, office, restaurant, etc). Note that in Table WUW-1.4, it is assumed that a Project Applicant commits to installing low-flow or high-efficiency fixtures for 100% of an end-use category (i.e. either 0% or 100% of toilets will be low-flow, either 0% or 100% of clothes washers will be high-efficiency, etc). The total percent reduction in GHG emissions expected from this mitigation measure is then simply the sum of all of the individual percent reductions:

$$\text{GHG emission reduction} = \sum \text{PercentReduction}_{\text{Fixture}}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions for indoor water use.

$\text{PercentReduction}_{\text{Fixture}}$ = Percent reduction in GHG emissions from each individual water fixture (i.e. toilet, bathroom faucet, dishwasher, etc.)
Provided in Table WUW-1.4

Method B

If the Project Applicant can provide detailed and substantial evidence to support a calculation of $\text{Water}_{\text{mitigated}}$, then that value can be used to calculate the percent GHG emission reduction using the following equation:

$$\text{GHG emission reduction} = \frac{\text{Water}_{\text{baseline}} - \text{Water}_{\text{mitigated}}}{\text{Water}_{\text{baseline}}}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions for indoor water use.

$\text{Water}_{\text{baseline}}$ = Total expected indoor water demand, without installation of low-flow and high-efficiency fixtures (million gallons)
Provided by Applicant

$\text{Water}_{\text{mitigated}}$ = Total calculated indoor water demand, after installation of low-flow and high-efficiency fixtures (million gallons)
Provided by Applicant or calculated using equations below

As shown in this equation, the carbon intensity of the local utility does not play a role in determining the percentage reduction in GHG emissions.

Method C

The Project Applicant may choose to install fixtures which exceed the requirements of the California Green Building Standards Code but have different flow rates than those specified in the Tables WUW-1.1 and WUW-1.3. To take credit for this mitigation measure, the Project Applicant would need to calculate the percent reduction in GHG emissions using the equations below. In these equations, it is assumed that a Project Applicant commits to installing low-flow or high-efficiency fixtures for 100% of an end-use category (i.e. either 0% or 100% of toilets will be low-flow, either 0% or 100% of clothes washers will be high-efficiency, etc). More complicated equations are necessary to account for less than 100% commitment in one or more end-use categories.

$$Water_{mitigated} = \sum EndUseWater_{mitigated}$$

End-Uses are toilets, urinals, showerheads, bathroom faucets, kitchen faucets, dishwashers, clothes washers, and leaks and other.

Where,

$$EndUseWater_{mitigated} = EndUse_{PercentIndoor} \times Water_{baseline} \times \frac{EndUseFlowRate_{mitigated}}{EndUseFlowRate_{unmitigated}}$$

$EndUse_{PercentIndoor}$ = % of Indoor Water Use for that end-use
Provided in Table WUW-1.1 for Residential Buildings
Provided in Table WUW-1.1 for Non-Residential Buildings

$Water_{baseline}$ = Total expected indoor water demand, without installation of low-flow and high-efficiency fixtures (million gallons)
Provided by Applicant

$EndUseFlowRate_{baseline}$ = Baseline current California standard water flow rate for that end-use
Provided in Table WUW-1.1 for Residential Buildings
Provided in Table WUW-1.3 for Non-Residential Buildings

$EndUseFlowRate_{mitigated}$ = Mitigated water flow rate for that end use
Provided by Applicant, supported by manufacturer specification or technical sheets

For the Leak, Other end use and all end-uses where the Project Applicant makes no commitment to installing low-flow or high-efficiency water fixtures, $EndUseFlowRate_{mitigated} = EndUseFlowRate_{unmitigated}$, so then $EndUseWater_{mitigated} = EndUse_{PercentIndoor} \times Water_{baseline}$.

Then the percent reduction in GHG emissions is calculated as follows:

$$\text{GHG emission reduction} = \frac{Water_{baseline} - Water_{mitigated}}{Water_{baseline}}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions for indoor water use.

$Water_{baseline}$ = Total expected indoor water demand, without installation of low-flow and high-efficiency fixtures (million gallons)
Provided by Applicant

$Water_{mitigated}$ = Total calculated indoor water demand, after installation of low-flow and high-efficiency fixtures (million gallons)
Calculated by Applicant using equation above

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	Estimated 20% reduction for residential buildings, assuming the Project Applicant commits to installing 100% of fixtures with the lowest flow rates presented in Table WUW-1.1. Estimated 17-31% reduction for non-residential buildings, assuming the Project Applicant commits to installing 100% of fixtures with the lowest flow rates presented in Table WUW-1.3.
All other pollutants	Not Quantified[87]

Discussion:

In this example, assume that a Project Applicant commits to installing the following:

For residences:

- 2010 CGBSC Mandatory Requirements for toilet, showerhead, bathroom faucet, and kitchen faucet
- ENERGY STAR residential standard dishwasher

For hotel:

- 2010 CGBSC Voluntary Standards for toilet, urinal, showerhead, bathroom faucet, and kitchen faucet
- ENERGY STAR top-loading clothes washer
- ENERGY STAR commercial dishwasher (high temp, under counter)

Using Method A, the following equation is employed:

$$\text{GHG emission reduction} = \sum PercentReduction_{Fixture}$$

[87] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

From Table WUW-1.4, the percent reduction in GHG emissions associated with indoor water use is then:

For residences:

$$6.6\% + 4.4\% + 5.7\% + 3.3\% + 0.2\% = 20.2\%$$

For hotel:

$$13.8\% + 5.4\% + 1.2\% + 0.8\% + 1.9\% + 6.4\% + 1.5\% = 31.0\%$$

Preferred Literature:

For the baseline scenario, the California Green Building Standards Code [1] specifies baseline water flow rates for toilets, showerheads, urinals, bathroom faucets, and kitchen faucets. The California Appliance Efficiency Regulation (Title 20) [2] specifies baseline water flow rates for residential and commercial dishwashers and clothes washers. For the mitigated scenario, the 2010 CGBSC also specifies water flow rates for toilets, showerheads, urinals, bathroom faucets, and kitchen faucets which become mandatory in 2011, additional voluntary flow rates for these same fixtures, and voluntary flow rates for commercial dishwashers and clothes washers. In addition, ENERGY STAR-certified residential and commercial dishwashers and clothes washers have mitigated water flow rates [5-8].

None

Other Literature Reviewed:

[9] USEPA. Water Sense: Product Factsheets and Final Specifications. Available online at: http://www.epa.gov/watersense/products/index.html. Accessed February 2010.

USEPA WaterSense labeled products include toilets, bathroom sink faucets, and flushing urinals, and are certified to meet USEPA's standards for improved water efficiency. While WaterSense models do perform with greater water efficiency than federal standard models, they are not more efficient than the models required in California starting in 2011 due to the 2010 CGBSC. Furthermore, WaterSense models are compared to federal standard models and calculations would need to be adjusted to account for differences in California standards. USEPA reports that toilets, bathroom faucets, and showers account for 30%, 15%, and 17% of indoor household water use, respectively. USEPA reports that WaterSense toilets use 20% less water than the federal standard model, while WaterSense bathroom faucets use 30% less water. Federal standard showerheads use 2.5 gallons of water per minute while the WaterSense models use 2.0 gallons of water per minute, which is equivalent to the 2010 CGBSC Mandatory Requirement. Further, federal standard flushing urinal models use 1.0 gallons per flush, while WaterSense models uses 0.5 gallons per flush, which is equivalent to the 2010 CGBSC Mandatory Requirement.

Table WUW-1.1
Reduction in Water use from Low-flow or High-efficiency Residential Water Fixtures

Fixture	% of Indoor Water Use[1]	Water Flow Rate				
		Baseline Current California Standard[2]	Mitigated 2010 California Green Building Standards Code (Mandatory in 2011)[3]	Mitigated 2010 California Green Building Standards Code (Voluntary)[4]	Mitigated ENERGY STAR[5]	Unit
Toilet	33%	1.6	1.28	--	--	gallons/flush
Showerhead	22%	2.5	2.0	--	--	gallons/minute @ 60 psi
Bathroom Faucet	18%	2.2	1.5	--	--	gallons/minute @ 60 psi
Kitchen Faucet		2.2	1.8	--	--	gallons/minute @ 60 psi
Standard Dishwasher	1%	6.5	--	5.8	5.0	gallons/cycle
Compact Dishwasher		4.5	--	--	3.5	gallons/cycle
Top-loading Clothes Washer	14%	6.0	--	--	6.0	gallons/cycle/ cubic foot
Front-loading Clothes Washer		6.0	--	--	6.0	gallons/cycle/ cubic foot
Leaks, Other	12%	--	--	--	--	--

Notes:

1. Indoor household end use of water 2000 estimates from Figure 2-4c of the Pacific Institute report.
2. Baseline water flow rates for toilets, showerheads, bathroom faucets, and kitchen faucets are from the 2010 California Green Building Standards Code. Baseline water flow rates for dishwashers and clothes washers are from CCR Title 20, Division 2, Chapter 4, Article 4, Section 1605.2 (Appliance Efficiency Regulations for appliances sold in California).
3. Mitigated water flow rates for toilets, showerheads, bathroom faucets, and kitchen faucets are voluntary in 2010 and mandatory starting January 1, 2011.
4. Mitigated water flow rates for dishwashers and clothes washers are voluntary.
5. In some cases, the 2011 ENERGY STAR dishwasher and clothes washer models have lower flow rates than the 2010 California Green Building Standards Code. Using these ENERGY STAR models results in an additional mitigation beyond what is recommended by the 2010 California Green Building Standards Code.

Front-loading Clothes Washer	9.5	--	8.6	6.0	gallons/cycle/ cubic foot

Notes:

1. Baseline water flow rates for toilets, showerheads, bathroom faucets, and kitchen faucets are from the 2010 California Green Building Standards Code. Baseline water flow rates for dishwashers are from the ENERGY STAR Commercial Dishwasher Calculator. Baseline water flow rates for clothes washers are from CCR Title 20, Division 2, Chapter 4, Article 4, Section 1605.2 (Appliance Efficiency Regulations for appliances sold in California).

2. These mitigated water flow rates for toilets, showerheads, bathroom faucets, and kitchen faucets are voluntary in 2010 and mandatory starting January 1, 2011.

3. These mitigated water flow rates for toilets, showerheads, bathroom faucets, and kitchen faucets are voluntary and represent the maximum recommended flow rate in order to achieve an overall 30% reduction in water use. Mitigated water flow rates for dishwashers and clothes washers are also voluntary. The range of values shown here represents different types of commercial dishwashers (high-temperature or chemical; conveyor, door, or undercounter models). See Appendix A5 of the 2010 California Green Building Standards Code for details.

4. In some cases, the ENERGY STAR dishwasher and clothes washer models have lower flow rates than the 2010 California Green Building Standards Code. Using these ENERGY STAR models results in an additional mitigation beyond what is recommended by the 2010 California Green Building Standards Code. See the following ENERGY STAR website for details: http://www.energystar.gov/index.cfm?c=comm_dishwashers.pr_crit_comm_dishwashers

Commercial Dishwasher: Low Temp, Door	N/A	0.7%	1.1%	4.3%	1.6%	0.8%	0.6%	0.2%
Commercial Dishwasher: Low Temp, Single Tank Conveyor	N/A	0.7%	1.1%	4.3%	1.6%	0.8%	0.6%	0.2%
Commercial Dishwasher: Low Temp, Multi Tank Conveyor	N/A	0.8%	1.4%	5.5%	2.0%	1.1%	0.8%	0.3%

Notes:

N/A indicates that either (a) an improved standard does not exist, or (b) the percent of indoor water use for that fixture and land use is typically zero. For example, (a) the ENERGY STAR standard for residential clothes washers is the same as the baseline current California standard, and (b) no water is expected to be used for laundry (clothes washers) in the Office land use.

4.2.2 Adopt a Water Conservation Strategy

Range of Effectiveness: Varies depending on Project Applicant and strategies selected. It is equal to the Percent Reduction in water commitment.

Measure Description:

Water use contributes to GHG emissions indirectly, via the production of the electricity that is used to pump, treat, and distribute the water. Reducing water use reduces energy demand and associated indirect GHG emissions.

This mitigation measure describes how to calculate GHG emissions reductions from a Water Conservation Strategy which achieves X% reduction in water use (where X% is the specific percentage reduction in water use committed to by the Project Applicant). The steps taken to achieve this X% reduction in water use can vary in nature and may incorporate technologies which have not yet been established at the time this document was written. In order to take credit for this mitigation measure, the Project Applicant would need to provide detailed and substantial evidence supporting the percent reduction in water use.

The expected percent reduction is applied to the baseline water use, calculated according to the baseline methodology document. The energy-intensity factor associated with water conveyance, treatment, and distribution is provided in the 2006 CEC report [1].

This measure may incorporate other mitigation measures (WUW-1 through 6) of this document. As such, if this measure is used, the other measures cannot be used. These measures can be consulted to assist in determining methods of quantification and typical ranges of effectiveness.

Measure Applicability:

- Indoor and/or Outdoor water use

Inputs:

The following information needs to be provided by the Project Applicant:

- Total expected water demand, without implementation of Water Conservation Strategy (million gallons)
- Percent reduction in water use after implementation of Water Conservation Strategy (%)

Baseline Method:

$$\text{GHG emissions} = \text{Water}_{\text{baseline}} \times \text{Electricity} \times \text{Utility}$$

Where:

GHG emissions = MT CO_2e

$Water_{baseline}$ = Total expected water demand, without implementation of Water Conservation Strategy (million gallons)

Provided by Applicant

Electricity = Electricity required to supply, treat, and distribute water (and for indoor uses, the electricity required to treat the wastewater) (kWh/million gallons)

Northern California Avg (outdoor uses): 3,500 kWh/million gallons [1]

Northern California Avg (indoor uses): 5,411 kWh/million gallons [1]

Southern California Avg (outdoor uses): 11,111 kWh/million gallons [1]

Southern California Avg (indoor uses): 13,022 kWh/million gallons [1]

Utility = Carbon intensity of Local Utility (CO_2e/kWh)

If there are percent reductions associated with both indoor and outdoor water use, the GHG emissions from indoor and outdoor water use should be calculated separately and then summed. Thus,

$$\text{Total GHG emissions} = \text{GHG emissions}_{indoor} + \text{GHG emissions}_{outdoor}$$

Mitigation Method:

Since this mitigation method does not change the electricity intensity factor (kWh/million gallons) associated with the supply and distribution of the water, the percent reduction in GHG emissions is dependent only on the change in water consumption:

$$\text{GHG emission reduction} = \text{PercentReduction}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions for water use.

PercentReduction = Expected percent reduction in water use after implementation of Water Conservation Strategy (%)

Provided by Applicant

As shown in these equations, the carbon intensity of the local utility does not play a role in determining the percentage reduction in GHG emissions.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	To be determined by Applicant

All other pollutants	Not Quantified[88]

Discussion:

The percent reduction in GHG emissions is equivalent to the percent reduction in indoor and outdoor water usage. Therefore, if a Project Applicant implements a Water Conservation Strategy which achieves a 10% reduction in water use, the GHG emissions associated with water use are reduced by 10%.

Assumptions:

Data based upon the following reference:

[1] CEC. 2006. Refining Estimates of Water-Related Energy Use in California. PIER Final Project Report. Prepared by Navigant Consulting, Inc. CEC-500-2006-118. Available online at: http://www.energy.ca.gov/2006publications/CEC-500-2006-118/CEC-500-2006-118.PDF

Preferred Literature:

2006 CEC report

Alternative Literature:

None

Other Literature Reviewed:

None

[88] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

4.2.3 Design Water-Efficient Landscapes

Range of Effectiveness: 0 – 70% reduction in GHG emissions from outdoor water use

Measure Description:

Water use contributes to GHG emissions indirectly, via the production of the electricity that is used to pump, treat, and distribute the water. Designing water-efficient landscapes for a project site reduces water consumption and the associated indirect GHG emissions. Examples of measures which a Project Applicant should consider when designing landscapes are reducing lawn sizes, planting vegetation with minimal water needs such as California native species, choosing vegetation appropriate for the climate of the project site, and choosing complimentary plants with similar water needs or which can provide each other with shade and/or water.

This measure describes how to calculate GHG savings from residential and commercial landscape plantings which have decreased watering demands compared to standard California landscape plantings. The methodology for calculating water demand presented here is based on the California Department of Water Resources (CDWR) 2009 Model Water Efficient Landscape Ordinance [1] and the CDWR 2000 report: “A Guide to Estimating Irrigation Water Needs of Landscape Plantings in California: The Landscape Coefficient Method and WUCOLS III” (“WUCOLS”) [2].

By January 1, 2010, all local water agencies were required to adopt the CDWR Model Water Efficient Landscape Ordinance or develop their own local ordinance which is at least as effective at conserving water as the Model Ordinance. Some local agencies have published or are in the process of developing local ordinances.[89] A Project Applicant may choose to use the methodology presented in a local ordinance to demonstrate a percent reduction in water use and GHG emissions; however, the calculations will be similar to the methodology presented in the CDWR Model Ordinance and re-described here.

Measure Applicability:

- Outdoor water use

Inputs:

The following information needs to be provided by the Project Applicant:

---

[89] List of local water agencies and a description of their plans to either adopt the CDWR Model Ordinance or develop their own ordinance: ftp://ftp.water.ca.gov/Model-Water-Efficient-Landscape-Ordinance/Local-Ordinances/

- $Water_{baseline}$, to be calculated by the Project Applicant using the methodology described below
- $Water_{mitigated}$, to be calculated by the Project Applicant using the methodology described below

Baseline Method:

The Project's baseline water use is the Maximum Applied Water Allowance (MAWA) described in the Model Water Efficient Landscape Ordinance:

$$MAWA = ET_0 \times 0.62 \times [(0.7 \times LA) + (0.3 \times SLA)]$$

Where:

MAWA	=	Maximum Applied Water Allowance (gallons per year)
ET_0	=	Annual Reference Evapotranspiration[90] from Appendix A of the Model Water Efficient Landscape Ordinance (inches per year)
0.7	=	ET Adjustment Factor (ETAF)
LA	=	Landscape Area[91] includes Special Landscape Area[92] (square feet)
0.62	=	Conversion factor (to gallons per square foot)
SLA	=	Portion of the landscape area identified as Special Landscape Area (square feet)
0.3	=	the additional ET Adjustment Factor for Special Landscape Area

Then the baseline GHG emissions are calculated as follows:

$$\text{GHG emissions} = \text{MAWA} \times \text{Electricity} \times \text{Utility}$$

Where:

GHG emissions = MT CO_2e

Electricity = Electricity required to supply, treat, and distribute water (kWh/million gallons)

Northern California Average (outdoor uses): 3,500 kWh/million gallons

Southern California Average (outdoor uses): 11,111 kWh/million gallons

[90] Evapotranspiration is water lost to the atmosphere due to evaporation from soil and transpiration from plant leaves. For a more detailed definition, see this California Irrigation Management Information System (CIMIS) website: http://wwwcimis.water.ca.gov/cimis/infoEtoOverview.jsp;jsessionid=91682943559928B8A9A243D2A2665E19

[91] § 491 Definitions in Model Water Efficient Landscape Ordinance: "Landscape Area (LA) means all the planting areas, turf areas, and water features in a landscape design plan subject to the Maximum Applied Water Allowance calculation. The landscape area does not include footprints of buildings or structures, sidewalks, driveways, parking lots, decks, patios, gravel or stone walks, other pervious or non-pervious hardscapes, and other non-irrigated areas designed for non-development (e.g., open spaces and existing native vegetation)."

[92] § 491 Definitions in Model Water Efficient Landscape Ordinance: "Special Landscape Area (SLA) means an area of the landscape dedicated solely to edible plants, areas irrigated with recycled water, water features using recycled water and areas dedicated to active play such as parks, sports fields, golf courses, and where turf provides a playing surface."

Utility = Carbon intensity of Local Utility (CO_2e/kWh)

Mitigation Method:

Since this mitigation method does not change the electricity intensity factor (kWh/million gallons) associated with the supply, treatment, and distribution of the water, the percent reduction in GHG emissions is dependent only on the change in water consumption.

The Project's mitigated water use is the Estimated Total Water Use (ETWU) described in the Model Water Efficient Landscape Ordinance:

$$\text{ETWU} = \text{ET0} \times 0.62 \times \left(\frac{\text{PF} \times \text{HA}}{\text{IE}} + \text{SLA}\right)$$

Where:

ETWU	=	Estimated total water use (gallons per year)
ET_0	=	Annual Reference Evapotranspiration from Appendix A of the Model Water Efficient Landscape Ordinance (inches per year)
PF	=	Plant Factor from WUCOLS[93] see Table WUW-3.1 for examples and WUCOLS for a complete list of values
HA	=	Hydrozone Area[94] (square feet)
SLA	=	Special Landscape Area (square feet)
0.62	=	Conversion factor (to gallons per square foot)
IE	=	Irrigation Efficiency[95] (minimum 0.71)

Then the percent reduction in GHG emissions is calculated as follows:

$$\text{GHG emission reduction} = \frac{\text{MAWA} - \text{ETWU}}{\text{MAWA}}$$

[93] § 491 Definitions in Model Water Efficient Landscape Ordinance: "Plant Factor (PF)" is a factor, when multiplied by ET_0, estimates the amount of water needed by plants." The Model Water Efficient Landscape Ordinance indicates that PF is 0-0.3 for low water use plants, 0.4-0.6 for moderate water use plants, and 0.7-1.0 for high water use plants. PF is equivalent to the "species factor" (k_s) in WUCOLS. See Table A above for examples of low, moderate, and high water use plants from WUCOLS. For a complete list of PF (k_s) values, see the species evaluation list in WUCOLS.

[94] § 491 Definitions in Model Water Efficient Landscape Ordinance: "Hydrozone means a portion of the landscaped area having plants with similar water needs. A hydrozone may be irrigated or non-irrigated."

[95] § 491 Definitions in Model Water Efficient Landscape Ordinance: "Irrigation Efficiency (IE) means the measurement of the amount of water beneficially used divided by the amount of water applied. Irrigation efficiency is derived from measurements and estimates of irrigation system characteristics and management practices. The minimum average irrigation efficiency for purposes of the ordinance is 0.71. Greater irrigation efficiency can be expected from well designed and maintained systems."

As shown in this equation, the regional electricity intensity factor and utility carbon intensity factor do not play a role in determining the percentage reduction in GHG emissions. Furthermore, since ET_0 is a multiplier in both MAWA and ETWU, it cancels out and therefore ET_0 does not play a role in determining the percentage reduction in GHG emissions either.

Table WUW-3.1: Example Plant Factor (PF) Values from WUCOLS

Water Needs	PF Range	Plant Type	Species Examples
Low	0 - 0.3	tree	Quercus agrifolia (coast live oak)
			Yucca
			Pinus halepensis (Aleppo pine)
		shrub	Quercus berberidifolia (California scrub oak)
			Lonicera subspicata (chaparral honeysuckle)
			Salvia apiana (white sage)
		vine	Macfadyena unguis-cati (cat's claw)
		groundcover	Arctostaphylos spp. (manzanita)
		perennial	Monardella villosa (coyote mint)
Moderate	0.4 - 0.6	tree	Acer negundo (California box elder)
			Acer paxii (evergreen maple)
		shrub	Buxus microphylla japonica (Japanese boxwood)
		vine	Wisteria
			Aristolochia durior (Dutchman's pipe)
		groundcover	Ceratostigma plumbaginoides (dwarf plumbago)
		perennial	Monarda didyma (bee balm)
	0.6	turf grasses (warm season)	Bermudagrass
			kikuyugrass
			seashore paspalum
			St. Augustinegrass
			zoysiagrass
High	0.7 - 1.0	tree	Betula pendula (European white birch)
			Betula nigra (river/red birch)
		shrub	Cyathea cooperii (Australian tree fern)
			Cornus stolonifera (red osier dogwood)
		groundcover	Soleirolia soleirolii (baby's tears)
		perennial	Mimulus spp., herbaceous (monkey flower)
			Woodwardia radicans (European chain fern)
			Acorus gramineus (sweet flag)
	0.8	turf grasses (cool season)	annual bluegrass
			annual ryegrass
			colonial bentgrass
			creeping bentgrass
			hard fescue
			highland bentgrass
			Kentucky bluegrass
			meadow fescue
			perennial ryegrass
			red fescue
			rough-stalked bluegrass
			tall fescue

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	Assuming an irrigation efficiency of 71% as specified in the Model Water Efficient Landscape Ordinance and no Special Landscape Area: • 0% reduction if 100% of vegetation is Moderate PF • 13% reduction if 40% of vegetation is Low PF, 40% is Moderate PF, and 20% is High PF • 35% reduction if 50% of vegetation is Low PF and 50% is Moderate PF • 70% reduction if 100% of vegetation is Low PF
All other pollutants	Not Quantified[96]

Discussion:

Example calculations of MAWA and ETWU are provided in the Model Water Efficient Landscape Ordinance. In this example, assume that the Project Applicant has used the equations to calculate MAWA = 100 million gallons and ETWU = 80 million gallons. Then the GHG emissions reduction is 20%:

$$\text{GHG Emission Reduced} = \frac{100-80}{100} = 0.2 \text{ or } 20\%$$

Assumptions:

Data based upon the following references:

Preferred Literature:

The California Department of Water Resources Model Water Efficient Landscape Ordinance requires that the Estimated Total Water Use (ETWU) of certain landscape

[96] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

projects shall not exceed the Maximum Applied Water Allowance (MAWA) for that landscape area. The MAWA is calculated based on average irrigation efficiencies and plant factors, two major influences on the water demand of a landscape. The ETWU is calculated based on project-specific plant factors and irrigation efficiency.

Alternative Literature:

[4] ("WUCOLS"): California Department of Water Resources. 2000. A Guide to Estimating Irrigation Water Needs of Landscape Plantings in California: The Landscape Coefficient Method and WUCOLS III. Available online at: http://www.water.ca.gov/pubs/conservation/a_guide_to_estimating_irrigation_water_needs_of_landscape_plantings_in_california__wucols/wucols00.pdf

[5] The Las Pilitas Nursery website has a user-friendly and searchable database of native California plants: http://www.laspilitas.com/shop/plant-products. As shown in WUCOLS, many California native plants have minimal or very low water needs.

The equation on page 9 of WUCOLS [4] shows that water demand for irrigation landscape plantings (ETL, landscape evapotranspiration) is calculated by multiplying two parameters: the landscape coefficient (KL) and the reference evapotranspiration (ETo). KL values are based on a species factor, density factor, and microclimate factor. The guidance provides detailed instructions on how to assign project-specific values for these three factors. KL can then be divided by the irrigation efficiency to obtain the Total Water Applied, as shown on page 31 of the guidance [4]. Total Water Applied is analogous to ETWU in the methodology shown above. Thus, the detailed WUCOLS methodology could be used to perform a more rigorous calculation of ETWU which incorporates microclimate effects (e.g. windy areas, areas shaded by buildings, etc) and vegetation density effects.

4.2.4 Use Water-Efficient Landscape Irrigation Systems

Range of Effectiveness: 6.1% reduction in GHG emissions from outdoor water

Measure Description:

Water use contributes to GHG emissions indirectly, via the production of the electricity that is used to pump, treat, and distribute the water. Using water-efficient landscape irrigation techniques such as “smart” irrigation technology reduces outdoor water demand, energy demand, and the associated GHG emissions.[97]

“Smart” irrigation control systems use weather, climate, and/or soil moisture data to automatically adjust watering schedules in response to environmental and climate changes, such as changes in temperature or precipitation levels. Thus, the appropriate amount of moisture for a certain vegetation type is maintained, and excessive watering is avoided. Many companies which design and install smart irrigation systems, such as Calsense, ET Water, and EPA-certified WaterSense Irrigation Partners, may be able to provide a site-specific estimate of the percent reduction in outdoor water use that can be expected from installing a smart irrigation system. Expected reductions are in the range of 1 – 30%, with the high end of the range associated with historically high water users. To take credit for the high end of the GHG emissions reductions based on these company quotes, the Project Applicant would need to provide detailed and substantial evidence supporting the proposed percent reduction in water use. Alternatively, the Project Applicant could apply the average percent reduction reported in a 2009 study conducted by Aquacraft, Inc. in cooperation with the California Department of Water Resources, the California Urban Water Conservation Council, and a consortium of California water utilities. This comprehensive study showed that smart irrigation systems of various brands achieve an average of 6.1% reduction in outdoor water use in California. This percent reduction is based on a two year study (one year pre and post installation of smart controllers) of over two thousand sites in seventeen different water utilities throughout northern and southern California. While the study also presents utility-specific percent reductions, variations in implementation and sample size between utilities renders these percent reductions insufficient for characterization in a mitigation measure at this time. The study also notes that for a sample of smart controllers where data was collected for three years after installation, the percent reduction in water use increased with time, with the greatest percent reduction achieved in year three.

---

[97] The installation of smart irrigation controllers will be required starting in 2011 as indicated in the 2010 Draft California Green Building Standards Code. As technology advances and newer generation smart irrigation controllers become available, the Project Applicant may choose to use this mitigation measure to quantify water use and associated GHG reductions beyond what would be achieved with the standards required by the California Green Building Standards Code.

The expected percent reduction is applied to the baseline water use, calculated according to the baseline methodology document. The energy-intensity factor associated with water conveyance and distribution is provided in the 2006 CEC report [2].

Measure Applicability:

- Outdoor water use

Inputs:

The following information needs to be provided by the Project Applicant:

- Total expected outdoor water demand, without installation of smart landscape irrigation controller (million gallons).
- (Optional) Project-specific percent reduction in outdoor water demand, after installation of smart landscape irrigation controller. Percent reduction must be verifiable. Otherwise, use the default value of 6.1%.

Baseline Method:

$$\text{GHG emissions} = \text{Water}_{\text{baseline}} \times \text{Electricity} \times \text{Utility}$$

Where:

GHG emissions = MT CO_2e

$\text{Water}_{\text{baseline}}$ = Total expected outdoor water demand, without installation of smart landscape irrigation controllers (million gallons)
Provided by Applicant

Electricity = Electricity required to supply, treat, and distribute water (kWh/million gallons)
Northern California Average: 3,500 kWh/million gallons
Southern California Average: 11,111 kWh/million gallons

Utility = Carbon intensity of Local Utility (CO_2e/kWh)

Mitigation Method:

Since this mitigation method does not change the electricity intensity factor (kWh/million gallons) associated with the supply and distribution of the water, the percent reduction in GHG emissions is dependent only on the change in water consumption:

$$\text{GHG emission reduction} = \text{PercentReduction} \times \text{Water}_{\text{baseline}}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions for outdoor water use.

$\text{Water}_{\text{baseline}}$ = Total expected outdoor water demand, without installation of smart landscape irrigation controllers (million gallons)

Provided by Applicant

PercentReduction = Expected percent reduction in water use after installation of smart landscape irrigation controllers (%)
Provided by Applicant or use default 6.1%

As shown in these equations, the carbon intensity of the local utility does not play a role in determining the percentage reduction in GHG emissions.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	6.1% unless project-specific data is provided
All other pollutants	Not Quantified[98]

Discussion:

The percent reduction in GHG emissions is equivalent to the percent reduction in outdoor water usage. Therefore, if a Project Applicant uses the default percent reduction in water usage associated with installing smart landscape irrigation control systems (6.1%), the resulting reduction in GHG emissions is also 6.1%.

Assumptions:

Data based upon the following references:

[1] “Evaluation of California Weather-Based “Smart” Irrigation Controller Programs.” July 2009. Presented to the California Department of Water Resources by The Metropolitan Water District of Southern California and The East Bay Municipal Utility District. Facilitated by the California Urban Water Conservation Council. Prepared by Aquacraft Inc., National Research Center Inc., and Dr. Peter J. Bickel. Available online at: http://www.aquacraft.com/Download_Reports/Evaluation_of_California_Smart_Controller_Programs_-_Final_Report.pdf

[2] CEC. 2006. Refining Estimates of Water-Related Energy Use in California. PIER Final Project Report. Prepared by Navigant Consulting, Inc. CEC-500-2006-118. Available online at: http://www.energy.ca.gov/2006publications/CEC-500-2006-118/CEC-500-2006-118.PDF

Preferred Literature:

As described above, the 2009 study [1] conducted by Aquacraft, Inc. in cooperation with the California Department of Water Resources, the California Urban Water Conservation Council, and a consortium of California water utilities showed that smart

[98] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

irrigation systems of various brands achieve an average of 6.1% reduction in outdoor water use in California.

Alternative Literature:

When common watering systems such as in-ground sprinklers are used, much of the water applied to lawns and landscapes is not absorbed by the vegetation. Instead, it is lost through runoff or evaporation. The USEPA reports that a study by the American Water Works Association found that households with in-ground sprinkler systems used 35% more water outdoors than households without these systems, while households with drip irrigation systems used 16% more water [3]. The USEPA reports that hand-held hoses or sprinklers are often more water efficient than automatic irrigation systems.

However, “smart” automatic landscape irrigation systems do exist. Examples include systems which automatically adjust watering schedules in response to environmental and climate changes, such as changes in temperature or precipitation levels. A few references have quantified reductions from this type of irrigation strategy. The Southern Nevada Water Authority reports that smart irrigation systems can reduce outdoor water use by an average of 15 to 30 percent, depending on the system, landscape type, and location [4]. One study conducted in 40 households with historically high water use in Irvine, California showed an average reduction in outdoor water use of 16% [5,6]. Another study conducted in Santa Barbara, California households with historically high water use showed an average water savings of 26% [5,7]. A Project Applicant could also hire an EPA-certified WaterSense Irrigation Partner to design and install a new irrigation system or audit an existing system in an effort to minimize the amount of water consumed [6].

4.2.5 Reduce Turf in Landscapes and Lawns

Range of Effectiveness: Varies and is equal to the percent commitment to turf reduction, assuming no other outdoor water uses

Measure Description:

Water use contributes to GHG emissions indirectly, via the production of the electricity that is used to pump, treat, and distribute the water. Turf grass (i.e. lawn grass) has relatively high water needs compared to most other types of vegetation. For example, trees planted in turf generally do not need additional watering besides what is required for the turf. Water agencies in Southern California have instituted turf removal programs which provide rebates for resident who reduce the turf area in their lawns. Reducing the turf size of landscapes and lawns reduces water consumption and the associated indirect GHG emissions.[99]

This measure describes how to calculate GHG savings from reducing the turf area of an existing lawn by X square feet, or designing a lawn to have X square feet less than the turf area of a standard lawn at the project location.[100]

Additional GHG emissions reductions may occur due to a reduction in fertilizer usage. Since this will vary based on individual occupant behavior, this reduction in GHG emissions from decreased fertilizer usage is not quantified.

Measure Applicability:

- Outdoor water use

Inputs:

The following information needs to be provided by the Project Applicant:

- Turf area of existing lawn or standard lawn at the project location (square feet)
- Turf area reduction commitment (square feet reduced or percent of baseline reduced)

Baseline Method:

---

[99] See the SoCal WaterSmart Residential Turf Program description at http://socalwatersmart.com/index.php?option=com_content&view=article&id=77&Itemid=10. Accessed March 2010.

[100] The Project Applicant would need to provide a value for and evidence supporting this "standard-sized lawn." This value is likely to vary greatly depending on the type of building (single-family, condo, apartment complex, commercial space) as well as location (region in California, urban or suburban).

The methodology for calculating water demand presented here is based on the California Department of Water Resources (CDWR) 2009 Model Water Efficient Landscape Ordinance [1] and the CDWR 2000 report: "A Guide to Estimating Irrigation Water Needs of Landscape Plantings in California: The Landscape Coefficient Method and WUCOLS III" [2].

The Project Applicant should first calculate the amount of water required to support the existing turf or standard-sized turf ($Water_{baseline}$).[101] In the equations below, "crop" also represents "turf grass," or lawn grasses.

$$ET_C = K_c \times ET_0$$

Where:

ET_C = Crop Evapotranspiration, the total amount of water the baseline turf loses during a specific time period due to evapotranspiration[102] (inches water/day)

K_C = Crop Coefficient, factor determined from field research, which compares the amount of water lost by the crop (e.g. turf) to the amount of water lost by a reference crop (unitless)
Species-specific; provided in Table WUW-5.1 below

ET_0 = Reference Evapotransporation, the amount of water lost by a reference crop (inches water/day)
Region-specific; provided in Appendix A of the CDWR Model Water Efficient Landscape Ordinance [1]

[101] Page 10 of the CDWR report explains that the objective of landscape management is to maintain the "health, appearance, and reasonable growth" of plants, and not necessarily to replenish all of the water lost at maximum evapotranspiration rates. Thus, the CDWR methodology presented here calculates only the amount of water required to sustain the health, appearance, and growth of the plants.

[102] Evapotranspiration is water lost to the atmosphere due to evaporation from soil and transpiration from plant leaves. For a more detailed definition, see this California Irrigation Management Information System (CIMIS) website: http://wwwcimis.water.ca.gov/cimis/infoEtoOverview.jsp;jsessionid=91682943559928B8A9A243D2A2665E19

Table WUW-5.1: Crop Coefficient for Turf Grasses

Category	Kc	Species
cool season grasses	0.8	annual bluegrass annual ryegrass colonial bentgrass creeping bentgrass hard fescue highland bentgrass Kentucky bluegrass meadow fescue perennial ryegrass red fescue rough-stalked bluegrass tall fescue
warm season grasses	0.6	Bermudagrass kikuyugrass seashore paspalum St. Augustinegrass zoysiagrass

Reference: p. 6 and p. 137 of CDWS report

Then: $$Water_{baseline} = ETC \times Area_{baseline} \times 0.62 \times 365$$

Where:

$Water_{baseline}$ = Volume of water required to support the baseline turf (gallons/year)
$Area_{baseline}$ = Area of existing or standard turf (square feet)
Provided by the Applicant
0.62 = conversion factor (gallons/squarefoot·inches water)
365 = conversion factor (days/year)
ETC = Crop evapotranspiration
Calculated using the equation on page 280

Then the baseline GHG emissions are calculated as follows:

$$GHG\ emissions = Water_{baseline} \times Electricity \times Utility$$

Where:

GHG emissions = MT CO_2e
Electricity = Electricity required to supply, treat, and distribute water (kWh/million gallons)

Northern California Average (outdoor uses): 3,500 kWh/million gallons
Southern California Average (outdoor uses): 11,111 kWh/million gallons
Utility = Carbon intensity of Local Utility (CO_2e/kWh)

Mitigation Method:

The equations above show that the GHG emissions are directly proportional to the water demand, which is in turn directly proportional to the area of the turf. Therefore, only the area of the existing or standard turf and the commitment to turf area reduction (square feet reduced or percent of baseline reduced) are needed to calculate the percent reduction in GHG emissions:

$$\text{GHG emission reduction} = \frac{\text{Area}_{\text{reduction}}}{\text{Area}_{\text{baseline}}} = \text{AreaPercentReduction}$$

Where:

$\text{Area}_{\text{reduction}}$ = Area of turf to be reduced (square feet)
Provided by the Applicant
$\text{Area}_{\text{baseline}}$ = Area of existing or standard turf (square feet)
Provided by the Applicant
AreaPercentReduction = Percent reduction in turf area (%)
Provided by the Applicant

As shown in this equation, the regional electricity intensity factor for water and the utility carbon intensity factor do not play a role in determining the percentage reduction in GHG emissions.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	Up to 100%, assuming 100% reduction in turf grass area. This would be the case for rock-lawns, for example.
All other pollutants	Not Quantified[103]

Discussion:

In this example, assume that the Project Applicant has provided detailed evidence to show that the turf area of a standard lawn at the project location is 8,000 square feet. If the Project Applicant then commits to reducing the turf area of lawns by 3,000 square feet, then the GHG emissions reduction is 37.5%.

[103] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

$$\text{GHG Emission Reduced} = \frac{3{,}000}{8{,}000} = 0.375 \text{ or } 37.5\%$$

Assumptions:

4.2.6 Plant Native or Drought-Resistant Trees and Vegetation

Range of Effectiveness: Best Management Practice; may be quantified if substantial evidence is available.

Measure Description:

California native plants within their natural climate zone and ecotype need minimal watering beyond normal rainfall, so less water is needed for irrigating native plants than non-native species. Drought-resistant vegetation needs even less watering. Water use contributes to GHG emissions indirectly, via the production of the electricity that is used to pump, treat, and distribute the water. Thus, planting native and drought-resistant vegetation reduces water use and the associated GHGs. Designing landscapes with native plants can provide many other benefits, including reducing the need for fertilization and pesticide use, and providing a more natural habitat for native wildlife. Although there is much anecdotal evidence for the benefits of planting native vegetation, few scientific studies have quantified the actual water savings. Therefore, this mitigation measure would most likely be employed as a Best Management Practice. Future studies may quantify the water-saving benefits of planting native or drought-resistant vegetation. In order to take quantitative credit for this mitigation measure, the Project Applicant would need to provide detailed and substantial evidence supporting a percent reduction in water use. The percent reduction would be applied to the baseline water use, calculated according to the baseline methodology described in WUW-3 (Design water efficient landscapes) and the baseline methodology document.

Measure Applicability:

- Outdoor water use

Inputs:

The following information needs to be provided by the Project Applicant:

- Percent reduction in water use, calculated using detailed and substantial evidence
- $Water_{baseline}$, to be calculated by the Project Applicant using the baseline methodology described in WUW-3 (Design water efficient landscapes) and the baseline methodology document

Baseline Method

See WUW-3 (Design water efficient landscapes)

Mitigation Method

Since this mitigation method does not change the electricity intensity factor (kWh/million gallons) associated with the supply, treatment, and distribution of the water, the percent reduction in GHG emissions is dependent only on the change in water consumption:

$$\text{GHG emission reduction} = \text{PercentReduction} \times \text{Water}_{baseline}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions for outdoor water use.

$\text{Water}_{baseline}$ = Baseline water demand, without planting native or drought-resistant vegetation

Provided by Applicant, calculated using baseline methodology of Mitigation Measure WUW-3

PercentReduction = Expected percent reduction in water use resulting from planting native or drought-resistant vegetation

Provided by Applicant

As shown in these equations, the carbon intensity of the local utility does not play a role in determining the percentage reduction in GHG emissions.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	To be determined by Applicant
All other pollutants	Not Quantified[104]

Discussion:

Currently there is not sufficient substantial evidence supporting a generalized reduction in emissions due to planting native or drought tolerant species. However, if the project applicant is able to provide sufficient substantial evidence supporting a reduction in water usage associated with native or drought tolerant species, the percent reduction in GHG emissions is equivalent to the percent reduction in outdoor water usage. Therefore, if a Project Applicant can support a 10% reduction in water use by native and drought tolerant species, the GHG emissions associated with water use are reduced by 10%.

Assumptions:

None

[104] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

Alternative Literature:

The EPA reports that while there is anecdotal evidence for the water-saving benefits of planting native and drought-resistant vegetation, there are very few scientific studies available which quantify the benefits. There are several good resources available which describe the qualitative benefits. The California Native Plant Society provides many resources for designing a native plant garden, including how to identify native plants and where to buy them. The Las Pilitas Nursery provides similar resources and also lists species of drought-resistant plants that are best for specific California regions. The EPA also provides tips for designing landscapes with native plants.

5.0 Landscaping Equipment

5.1 Landscaping Equipment

5.1.1 Prohibit Gas Powered Landscape Equipment.

Measure Description:

Electric lawn equipment including lawn mowers, leaf blowers and vacuums, shredders, trimmers, and chain saws are available. When electric landscape equipment is used in place of a conventional gas-powered equipment, direct GHG emissions from natural gas combustion are replaced with indirect GHG emissions associated with the electricity used to power the equipment.

Measure Applicability:

[1] Landscaping equipment

Inputs:

The following information needs to be provided by the Project Applicant:

- Electricity provider for the Project
- Horsepower of landscaping equipment
- Hours of operation

Baseline Method:

Look up landscape equipment emission factor based on type of fuel used:

Landscaping Equipment Horsepower	CO_2 Emission Factor from Gasoline (g/hp-hr)
< 25	429.44
25 – 50	783.30
50 – 120	774.50
120 –175	753.25
> 175	732.00

$$\text{GHG emission} = EF \times Hp \times LF \times Hr \times 10^{-6}$$

Where:

GHG emission = MT CO_2e per year

EF = CO_2 emission factor for the relevant horsepower tier show in table above (g/hp-hr). Obtained from OFFROAD2007.

Hp = Horsepower of landscaping equipment
LF = Load factor of equipment for the relevant horsepower tier (dimensionless). Obtained from OFFROAD2007.
Hr = Hours of operation per year
10^{-6} = Unit conversion from grams to MT

Mitigation Method:

Landscaping equipment will run on electricity instead of gasoline. The indirect GHG emission from electricity generation is:

$$\text{GHG emission} = \text{Utility} \times \text{Hp} \times \text{LF} \times \text{Hr} \times \text{C}$$

Where:
GHG emissions = MT CO_2e
Utility = Carbon intensity of Local Utility (CO_2e/kWh). See table below.
Hp = Horsepower of landscaping equipment.
LF = Load factor of equipment for the relevant horsepower tier (dimensionless). Obtained from OFFROAD2007.
Hr = Hours of operation.
C = Unit conversion factor

Power Utility	Carbon-Intensity (lb CO_2e/kWh)
LADWP	1,238
PG&E	456
SCE	641
SDGE	781
SMUD	555

GHG Reduction %[105] $= 1 - \dfrac{\text{Utility} \times \text{C}}{\text{EF} \times 10^{-6}}$

EF = Emission Factor for the relevant fuel horsepower tier (g/hp-hr) Obtained from OFFROAD2007. See accompanying tables.

Emission Reduction Ranges and Variables:

Power Utility	Equipment Horsepower	Project GHG Emission Reductions
LADWP	< 25	2.5%
	25 – 50	46.5%

[105] This assumes energy from engine losses are the same.

Power Utility	Equipment Horsepower	Project GHG Emission Reductions
	50 – 120	45.9%
	120 –175	44.4%
	> 175	42.8%
PG&E	< 25	64.1%
	25 – 50	80.3%
	50 – 120	80.1%
	120 –175	79.5%
	> 175	78.9%
SCE	< 25	49.5%
	25 – 50	72.3%
	50 – 120	72.0%
	120 –175	71.2%
	> 175	70.4%
SDGE	< 25	38.5%
	25 – 50	66.3%
	50 – 120	65.9%
	120 –175	64.9%
	> 175	63.9%
SMUD	< 25	56.3%
	25 – 50	76.0%
	50 – 120	75.8%
	120 –175	75.1%
	> 175	74.3%

Criteria pollutants will be reduced by reduction in combustion. They will also increase through the increase in energy use. However, the increase may not be in the same air basin.

Discussion:

The output from OFFROAD2007 shows the same emissions within each horsepower tier regardless of the year modeled. Therefore, the emission reduction is dependent on the location of the Project and horsepower of the landscaping equipment only.

Assumptions:

Data based upon the following references:

California Air Resources Board. Off-road Emissions Inventory. OFFROAD2007. Available online at: http://www.arb.ca.gov/msei/offroad/offroad.htm

California Climate Action Registry Reporting Online Tool. 2006 PUP Reports. Available online at: https://www.climateregistry.org/CARROT/public/reports.aspx

Preferred Literature:

The amount of direct GHG emissions avoided can be calculated using CARB's OFFROAD model, which provides state-wide and regional emission factors for different types of landscaping equipment that can be converted to grams per horsepower-hour [1]. Multiplying this factor by the typical horsepower and load factor of the equipment and number of hours of operation gives the direct GHG emissions. Assuming the same number of operating hours and power output as the gas-powered equipment, the same amount of energy consumption multiplied by the carbon-intensity factor of the local utility gives the amount of indirect GHG emissions associated with using the electric landscape equipment. The GHG emissions reduction associated with this mitigation measure is therefore the difference in emissions from these two scenarios.

Companion Strategy:

In order to take credit for Mitigation Measure 80, a Project Applicant must also commit to providing electrical outlets on the exterior of all buildings (Mitigation Measure 60) so that electrical lawn equipment is compatible with built facilities.

5.1.2 Implement Lawnmower Exchange Program

Range of Effectiveness: Best Management Practice, influences Area GHG emissions from landscape equipment

Measure Description:
When electric and rechargeable battery-powered lawnmowers are used in place of conventional gas-powered lawnmowers, direct GHG emissions from fuel combustion are displaced by indirect GHG emissions associated with the electricity used to power the equipment. The indirect GHG emissions from electricity generation are expected to be significantly less than the direct GHG emissions from gasoline or diesel fuel combustion. Since the magnitude of the GHG emissions reduction depends on the equipment model (including electric power efficiency and battery recharge time), hours of operation, fuel displaced, and number of lawnmowers replaced, the exact GHG emissions reduction is not quantifiable at this time. Therefore, this mitigation measure should be incorporated as a Best Management Practice to allow for educated residents and commercial tenants to reduce their contribution to GHG emissions from landscaping. Many California Air Districts, including eight air districts supported by the CARB Lawn and Garden Equipment Replacement (LGER) Project, already have lawnmower exchange programs in place. This Best Management Practice could involve participating in these established lawnmower exchange programs, supplementing the established programs, or implementing a new program for the Project. The Project Applicant should check with the local air district regarding participating in established programs. The Project Applicant could take quantitative credit for this mitigation measure if detailed and substantial evidence were provided.

Measure Applicability:
- GHG emissions from landscaping

Assumptions:
Data based upon the following references:

- CARB. AB118 Lawn and Garden Equipment Replacement Project. Available online at: http://www.arb.ca.gov/msprog/aqip/lger.htm. Accessed February 2010.
- SCAQMD. Mow Down Air Pollution Electric Lawn Mower Exchange. Available online at: http://www.aqmd.gov/tao/lawnmower2009.html. Accessed February 2010.
- VCAPD. Lawn Mower Trade-In Program for Ventura County Residents. Available online at: http://www.vcapcd.org/LawnMower_EN.htm. Accessed February 2010.
- SMAQMD. Mow Down Air Pollution. Available online at: http://www.airquality.org/mobile/mowdown/index.shtml. Accessed February 2010.

Emission Reduction Ranges and Variables:
This is a Best Management Practice and therefore there is no quantifiable reduction at this time. Check with local agencies for guidance on any allowed reductions associated with implementation of best management practices.

Preferred Literature:
CARB's Lawn and Garden Equipment Replacement (LGER) Project was established to encourage the use of cordless zero-emission lawn and garden equipment and to help bring more electric equipment to the market. The LGER Project provides vouchers for electric cordless residential lawn mowers valued up to $250 for each gas-powered lawnmower turned in. The LGER Project provides grants to eight air districts with existing lawnmower exchange programs, including AVAQMD, MDAQMD, SCAQMD, SDAPCD, SJVAPCD, SMAQMD, VCAPCD, and YSAQMD. Individual air districts may offer vouchers of different values.

Alternative Literature:

None

- USEPA. Improving Air Quality in Your Community: Outdoor Air – Transportation: Lawn Equipment. Available online at: http://www.epa.gov/air/community/details/yardequip.html. Accessed February 2010.

5.1.3 Electric Yard Equipment Compatibility

Range of Effectiveness: Best Management Practice, influences Area GHG emissions from landscape equipment. Not applicable on its own. This measure enhances effectiveness of A-1 and A-2.

Measure Description:

This measure is required to be grouped with measures A-1 “Prohibit Gas Powered Landscape Equipment” and A-2 “Implement a Lawnmower Exchange Program.” In order for measures A-1 and A-2 to be feasible, electrical outlets on the exterior of buildings must be accessible so that the electric landscaping equipment can be charged. In this mitigation measure, the Project Applicant commits to providing electrical outlets on the exterior of Project buildings as necessary for sufficient powering of electric lawnmowers and other landscaping equipment.

Measure Applicability:

- This measure is part of a grouped measure
- This measure contributes to reductions in GHG emissions from landscaping

Emission Reduction Ranges and Variables:

This measure is a Best Management Practice grouped with other measures and therefore there is no quantifiable reduction at this time. Check with local agencies for guidance on any allowed reductions associated with implementation of Best Management Practices.

Preferred Literature:

None

6.0 Solid Waste

6.1 Sold Waste

6.1.1 Institute or Extend Recycling and Composting Services

Range of Effectiveness: Varies depending on Project Applicant and strategies selected. Best Management Practice.

Measure Description:
The transport and decomposition of landfill waste and the flaring of landfill gas all produce GHG emissions. Decomposition of waste produces methane, a GHG which has a global warming potential over 20 times that of CO_2. The transport of waste from the site of generation to the landfill produces GHG emissions from the combustion of the fuel used to power the vehicle. Choosing waste management practices which reduce the amount of waste sent to landfills will reduce GHG emissions. Strategies to reduce landfill waste include increasing recycling, reuse, and composting, and encouraging lifestyle choices and office practices which reduce waste generation.

Current protocols for quantifying emissions reductions from diverted landfill waste developed by the USEPA and the California Center for Integrated Waste Management Board (CIWMB) are based on life-cycle approaches, which reflect emissions and reductions in both the upstream and downstream processes around waste management. The Project Applicant should seek local agency guidance on comparing and/or combining operational emissions inventories and life cycle emissions inventories.

Furthermore, while tools are available to quantify the avoided landfill GHG emissions from a specified amount of diverted or recycled waste, taking credit for this mitigation measure also requires the determination of the effects of instituting or extending recycling and composting services. Since both government and privately-sponsored recycling and composting programs vary dramatically in scope, waste materials accepted, and outreach efforts, no literature references exist which provide default values for percent of waste diverted. To take credit for this measure, the Project Applicant would need to provide detailed and substantial evidence supporting the amount of waste reduced or diverted to recycling and composting due to the institution of extended recycling and composting services.

Measure Applicability:

[2] Solid waste disposed to landfill

Inputs:
The following information needs to be provided by the Project Applicant:

- For residential buildings: number of residents
- For shopping malls and office buildings: building square footage
- For public venues: annual number of visitors
- For all other commercial buildings: number of employees
- Waste disposal method
- Amount of waste reduced or diverted to recycling and composting due to the institution of extended recycling and composting services.

Baseline Method:
The Project Applicant must first calculate the total amount of waste generated at the project.

For residential buildings and all commercial buildings except shopping malls and offices:

$$Waste_{baseline\ total} = People \times DisposalRate$$

For shopping malls and office buildings:

$$Waste_{baseline\ total} = SF \times DisposalRate$$

Where:

People = Number of residents, employees, or visitors (for public venues)
Provided by Applicant
SF = Square feet of building
Provided by Applicant
DisposalRate = Annual disposal rate of waste (tons/resident/year, tons/employee/year, or tons/visitor/year)
From Tables SW-1.1 and SW-1.2

The total waste stream is then portioned into material-specific streams (paper, glass, metal, plastic, etc.) using the percentages listed in Table SW-1.3.

USEPA's Waste Reduction Model (WARM) is used to quantify baseline emissions and emissions reductions from diverting landfill waste to composting or recycling. This web-based tool is available online at http://www.epa.gov/climatechange/wycd/waste/calculators/Warm_Form.html. The required inputs are the tons of waste associated with one of three waste management practices: landfill (baseline scenario), recycled (mitigated scenario), combusted (not applicable in California), and composted (mitigated scenario). The amount of each type of waste in tons is entered into the "Tons Landfilled" column in the Baseline Scenario of

WARM to calculate the baseline GHG emissions in metric MT carbon equivalent (MTCE). Other input variables include landfill type (presence of landfill gas control system or not) and distance of waste transport; however, default values can be used.

Mitigation Method:
In WARM, the project applicant specifies the amount of waste associated with each of the three alternative scenarios: waste reduced (e.g. reduced waste generation), waste recycled, and waste composted. WARM then calculates the GHG savings associated with the alternative scenarios as compared with the baseline scenario.

Assumptions:
Data based upon the following reference:

- USEPA. 2009. Waste Reduction Model. Available online at: http://www.epa.gov/climatechange/wycd/waste/calculators/Warm_home.html
- CIWMB. 1999. Statewide Waste Characterization Study: Final Results and Report. Available online at: http://www.calrecycle.ca.gov/publications/LocalAsst/34000009.pdf
- CIWMB. 2006. Targeted Statewide Waste Characterization Study: Waste Disposal and Diversion Findings for Selected Industry Groups. Available online at: http://www.ciwmb.ca.gov/WasteChar/WasteStudies.htm#2006Industry

Preferred Literature:
USEPA's WARM was developed to track GHG emission reductions from various waste management options. This tool calculates the GHG emissions associated with a baseline waste management strategy, as well as those associated with an alternative strategy that may include source reduction, recycling, composting, combusting, or landfilling. WARM then calculates the GHG savings associated with the alternative strategy as compared with the baseline strategy. WARM requires input of the estimated tons of waste per material type per disposal strategy. There are 34 different material types (e.g., aluminum cans, mixed paper, yard trimmings, carpet). Other input variables include landfill type (presence of landfill gas control system or not) and distance of waste transport; however, default values can be used. Note that WARM was developed based on a life-cycle approach, which reflects emissions and reductions in both the upstream and downstream processes around waste management. USEPA notes that emission factors developed based on this life cycle approach are not appropriate for use in GHG inventories.

6.1.2 Recycle Demolished Construction Material

Range of Effectiveness: Varies depending on Project Applicant and strategies selected. Best Management Practice.

Measure Description:
Recycling demolished construction material can contribute to GHG reductions in multiple ways. First, it displaces new construction materials, thereby reducing the need for new raw material acquisition and manufacturing of those new construction materials. Harvesting of raw materials and manufacturing new materials requires energy in the form of fuel combustion and electricity, both of which are associated with GHG emissions. If the process of recycling construction materials is less carbon-intensive than the processes required to harvest and produce new construction materials, recycling these construction materials results in a net reduction in GHG emissions. Second, using local recycled construction material reduces the emissions associated with the transportation of new construction materials, which are typically manufactured farther away from a project site. Third, recycling construction material avoids sending this material to landfills. Wood-based materials decompose in landfills and contribute to methane emissions.

Unlike measures which reduce GHG emissions during the operational lifetime of a project, such as reducing building electricity and water usage, this mitigation effort is realized prior to the actual operational lifetime of a project. Therefore, these GHG emissions reductions are best quantified in terms of a life-cycle analysis. Life cycle analyses examine all stages of the life of a product, including raw material acquisition, manufacture, transportation, installation, use, and disposal or recycling. The Project Applicant should seek local agency guidance on comparing and/or combining operational emissions inventories and life cycle emissions inventories.

Measure Applicability:

- Life cycle emissions from construction materials

Preferred Literature:
The California Integrated Waste Management Board (CIWMB) cites decreases in greenhouse gas emissions as a benefit of construction waste management and recycling in its document “Construction Waste Management” which is used as part of California Sustainable Design Training. The document is available online at: www.calrecycle.ca.gov/greenbuilding/training/statemanual/waste.doc

7.0 Vegetation

7.1 Vegetation

7.1.1 Urban Tree Planting

Range of Effectiveness: CO_2 reduction varies by the number of trees. VOC emissions may increase.

Measure Description:

Planting trees sequesters CO_2 while the trees are actively growing. The amount of CO_2 sequestered depends on the type of tree. IPCC indicates that in most cases, the active growing period of a tree is 20 years and after this time the amount of carbon in biomass slows and will be completely offset by losses from clipping, pruning, and occasional death [1]. Therefore, the emissions only occur for a 20 year period and are summed over all years to give a net one-time GHG benefit.

If large areas of trees will be planted, the lead agency may want to ensure enforceability by requiring submission of annual inventory consistent with the Urban Forest Protocol [2]. This is a comprehensive protocol that requires maintenance and replacement of trees. If the Project Applicant desires to use this approach, calculation methodologies and assumptions presented in the protocol should be used. The information required to implement this protocol is often not available at the time of the CEQA process.

The type of tree species planted will result in varying degrees of carbon sequestration. In addition, trees emit volatile organic compounds (VOCs), which are criteria pollutant precursors. Therefore the Project Applicant may want to consider these issues when selecting the type of tree to plant. See [3] for details on low-VOC trees.

Measure Applicability:

- New trees

Inputs:

The following information needs to be provided by the Project Applicant:

- Species classes of trees planted, if known
- Number of net new trees in each species class, if known
- Total number of net new trees

Baseline Method:

In the baseline case, there are no net new trees planted.

Mitigation Method:

Look up default annual CO_2 sequestration rates on a per tree basis:

Broad species class	**Default annual CO_2 accumulation per tree[1] (MT CO_2/ year)**
Aspen	0.0352
Soft maple	0.0433
Mixed hardwood	0.0367
Hardwood maple	0.0521
Juniper	0.0121
Cedar/larch	0.0264
Douglas fir	0.0447
True fir/Hemlock	0.0381
Pine	0.0319
Spruce	0.0337
Miscellaneous[2]	0.0354

1. IPCC's carbon (C) values converted to carbon dioxide (CO_2) using ratio of molecular weights (44/12).
2. Average of all other broad species classes. To be assumed if tree type is not known.

Therefore, the reduction in GHG emissions associated with planting new trees is:

$$\text{GHG emission reduction} = (\text{Growing Period} \times \sum_{i=1}^{n} [\text{ Sequestration } i \times \text{Trees } i\,]\,) \div \text{Total GHG emissions}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions as compared to total GHG emissions.
Growing Period = Growing period for all trees, expressed in years (20).
n = Number of broad species classes. Provided by Applicant.
Sequestration *i* = Default annual CO_2 accumulation per tree for broad species class *i.* Lookup in table above.
Trees *i* = Number of net new trees of broad species class *i.*
Total GHG emissions = Total GHG emissions*.* Provided by Applicant.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	Varies based on number of trees
VOC	May increase
All other pollutants	Not Quantified

Discussion:

If the applicant has baseline total project emissions of 5,000 MT CO_2e per year, and if the applicant elects to mitigate GHG emissions by committing to planting 500 net new “miscellaneous” trees, the applicant would reduce the amount of GHG emissions associated with the project by 7%.

$$\text{GHG Emission Reduced} = \frac{20 \times 0.0354 \times 500}{5{,}000} = 0.07 \text{ or } 7\%$$

Assumptions:

Data based upon the following reference:

[1] IPCC. 2006. 2006 IPCC Guidelines for National Greenhouse Gas Inventories, Volume 4, Table 8.2. Available online at: http://www.ipcc-nggip.iges.or.jp/public/2006gl/pdf/4_Volume4/V4_08_Ch8_Settlements.pdf

Preferred Literature:

The IPCC Guidelines [1] provide a method for estimating the amount of carbon sequestered by trees. IPCC default annual CO_2 sequestration rates on a per tree basis are used. Table 8.2 of the IPCC Guidelines provides species class-specific sequestration values. For species that do not appear or if the species is unknown, the average value from Table 8.2 (0.035 MT CO_2 per year per tree) can be assumed to be representative of trees planted. Urban trees are only net carbon sinks when they are actively growing. The IPCC assumes an active growing period of 20 years (see p. 8.9). Thereafter, the accumulation of carbon in biomass slows with age, and will be completely offset by losses from clipping, pruning, and occasional death. Actual active growing periods are subject to, among other things, species, climate regime, and planting density. Additional credit may be taken for planting native trees. See WUW-3 for details on the design of water-efficient landscaping.

Alternative Literature:

The Center for Urban Forest Research Tree Carbon Calculator is based on a small set of data and extrapolates annual tree girth increases for various tree species [1]. Furthermore, it extrapolates the amount of carbon associated with a given girth for each tree species. This method is based on extrapolation of a limited dataset. In addition it requires considerably more input requirements that may not be available for CEQA projects. These inputs include knowledge of specific tree species that will be planted and assumptions regarding anticipated growth rates. Considering the order of magnitude of mitigation from this option, the additional complexity of this method would not generally be warranted for most CEQA projects.

The CAR Urban Forest Sector Protocol [2] provides guidelines for estimating the amount of CO_2 sequestered by common California tree species. This methodology would require Project Applicants to know the tree species to be planted at the time the CEQA analysis is prepared. Furthermore, this methodology would require Project Applicants to estimate the expected diameter of trees, which is dependent on climate and tree sub-species, among other things.

7.1.2 Create New Vegetated Open Space

Range of Effectiveness: varies based on amount and type of land vegetated

Measure Description:

A development which re-vegetates or creates vegetated land from previously settled land sequesters CO_2 from the atmosphere which would not have been captured had there been no land-type change. There is no reduction in GHG emissions associated with preservation of a land.

Measure Applicability:

- Open space

Inputs:

The following information needs to be provided by the Project Applicant:

- Types of land uses created
- Acres of each land use created

Baseline Method:

In the baseline case, there is no preserved or created open space.

Mitigation Method:

Lookup carbon dioxide sequestered per acre for each land use that will be preserved or created:

Land Use	Sub-Category	Default annual CO_2 accumulation per acre[1] (MT CO_2/ acre)
Forest Land	Scrub	14.3
	Trees	111
Cropland	--	6.9
Grassland	--	4.31
Wetlands	--	0

1. Calculated by multiplying total biomass (MT dry matter/acre) from IPCC data by the carbon fraction in plant material (0.47), then using the ratio of molecular weights (44/12) to convert from MT of carbon (C) to MT of carbon dioxide (CO_2).

Land uses are defined by IPCC as follows:

(i) Forest Land

This category includes all land with woody vegetation consistent with thresholds used to define Forest Land in the national greenhouse gas inventory. It also includes systems with a vegetation structure that currently fall below, but *in situ* could potentially reach the threshold values used by a country to define the Forest Land category.

(ii) Cropland

This category includes cropped land, including rice fields, and agro-forestry systems where the vegetation structure falls below the thresholds used for the Forest Land category.

(iii) Grassland

This category includes rangelands and pasture land that are not considered Cropland. It also includes systems with woody vegetation and other non-grass vegetation such as herbs and brushes that fall below the threshold values used in the Forest Land category. The category also includes all grassland from wild lands to recreational areas as well as agricultural and silvi-pastural systems, consistent with national definitions.

(iv) Wetlands

This category includes areas of peat extraction and land that is covered or saturated by water for all or part of the year (e.g., peatlands) and that does not fall into the Forest Land, Cropland, Grassland or Settlements categories. It includes reservoirs as a managed sub-division and natural rivers and lakes as unmanaged sub-divisions.

$$\text{GHG emission reduction} = \left(\sum_{i=1}^{n} [\text{ Sequestration } i \times \text{Acres } i\ ] \right) \div \text{Total GHG emissions}$$

Where:

GHG emission reduction = Percentage reduction in GHG emissions as compared to total GHG emissions.

n = Number of land uses. Provided by Applicant.

Sequestration *i* = Default annual CO_2 accumulation per acre for land use *i.* Look up in table above.

Acres *i* = Number of acres of land use *i.*

Total GHG emissions = Total one-time GHG emissions. Provided by Applicant.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	Varies
All other pollutants	Not Quantified

Discussion:

If the applicant has baseline one-time emissions of 5,000 MT CO_2e per year, and if the applicant elects to mitigate GHG emissions by committing to creating 50 acres of forest land (scrub) and 20 acres of grassland, the applicant would reduce the amount of one-time GHG emissions by 16%.

$$\text{GHG Emission Reduced} = \frac{14.3 \times 50 + 4.31 \times 20}{5{,}000} = 0.16 \text{ or } 16\%$$

Assumptions:

Data based upon the following references:

[1] IPCC. 2006. 2006 IPCC Guidelines for National Greenhouse Gas Inventories, Volume 4. Available online at: http://www.ipcc-nggip.iges.or.jp/public/2006gl/vol4.html

Preferred Literature:

The IPCC Guidelines provide a method for calculating changes in CO_2 sequestration due to land-type conversions. While other methods exist, notably the CCAR Forest Protocol [2], the IPCC Guidelines [1] have more general default values available that will be applicable to all areas of California without requiring detailed site-specific information. A general knowledge of the proposed change in land type is sufficient to quantify reductions in greenhouse gas emissions. IPCC designates four general vegetation types: forest land, cropland, grassland, and wetland. The amount of sequestered CO_2 is calculated based on the amount of carbon stock in each type of biomass (MT carbon / hectare vegetation). IPCC defaults for the carbon stock in each vegetation type are summarized in Table 8.4. (Note that this table represents the amount of carbon removed due to land conversion to settlements; it can also be used to calculate the amount of carbon sequestered due to conversion from settlement to vegetated land. Note also that a conversion to wetlands is not relevant for California). In addition to general default values, the IPCC Guidelines have climate and species-specific data available which can be used if details of the proposed development are known. To calculate the final mass of CO_2, the mass of carbon is then multiplied by 3.67, which is the ratio of molecular mass of CO_2 to the molecular mass of carbon. This method assumes that all of the carbon is converted into CO_2, which is appropriate for most CEQA projects.

Alternative Literature:

The CAR Forest Sector Protocol provides guidelines for estimating the amount of CO_2 sequestered by vegetated land [1]. The Protocol is specific to forest land only, and is not appropriate for estimating land-type conversions to or from cropland or grassland. Additionally, the methodology is limited to conversions from vegetated land to settlement or settlement to vegetated land, but is not appropriate for changes from one vegetated land type to another vegetated land type. The Protocol recommends accounting for changes in the organic carbon content of soil, which requires soil sampling and testing. While testing of existing soil is feasible, the protocol does not provide adequate methods for predicting the future soil organic carbon content after a land-type conversion has taken places. Furthermore, soil testing may be a burdensome task for a Project Applicant. Methodologies which provide default values, such as the IPCC Guidelines, are preferable.

8.0 Construction

8.1 Construction

8.1.1 Use Alternative Fuels for Construction Equipment

Range of Effectiveness: 0 – 22% reduction in GHG emissions

Measure Description:

When construction equipment is powered by alternative fuels such as compressed natural gas rather than conventional petroleum diesel or gasoline, GHG emissions from fuel combustion may be reduced.

Measure Applicability:

[3] Construction vehicles

Inputs:

The following information needs to be provided by the Project Applicant:

- Fuel type and Horsepower of Construction Equipment
- Hours of operation

Baseline Method:

For all pollutants besides ROG emissions from gasoline-fueled equipment, total emission is equivalent to exhaust emission and is calculated as follows:

$$\text{Exhaust Emission} = \frac{\text{Exhaust}}{\text{Activity} \times \text{AvgHP}} \times Hp \times Hr \times C$$

Where:

Exhaust Emission= MT or tons of pollutant per year

Exhaust = Statewide daily emission from equipment for the relevant horsepower tier of diesel or gasoline fuel (tons/day). Obtained from OFFROAD2007.

Activity = Statewide daily average operating hours for the relevant horsepower tier (hours/day). Obtained from OFFROAD2007.

AvgHP = Average horsepower for the relevant horsepower tier (HP). Obtained from OFFROAD2007.

Hp = Horsepower of equipment.

Hr = Hours of operation.

C = Unit conversion factor

Note that this method assumes the load factor of the equipment is same as the default in OFFROAD2007.

Total GHG emission is calculated as follows:

$$\text{GHG Emission} = CO_2\text{ Emission} + CH_4\text{ Emission} \times 21 + N_2O\text{ Emission} \times 310$$

Where:

GHG Emission = MT CO_2e

CO_2 Emission = CO_2 emission calculated as described above with data from OFFROAD2007.

CH_4 Emission = CH_4 emission calculated as described above with data from OFFROAD2007.

N_2O Emission = N_2O emission calculated as described above with data from OFFROAD2007.

21 = Global warming potential of CH_4 following CCAR GPR 2009.

310 = Global warming potential of N_2O following CCAR GPR 2009.

Total ROG emission from gasoline-fueled equipment is calculated as follows:

$$\text{Total ROG Emission} = \text{Exhaust ROG Emission} + \frac{\text{Resting} + \text{Diurnal} + \text{Hot Soak} + \text{Evaporative}}{\text{Activity} \times \text{AvgHP}} \times Hp \times Hr \times C$$

Where:

Total ROG Emission = Tons of ROG emission per year

Exhaust ROG Emission = ROG emission from exhaust calculated as described above (tons/year)

Resting = Statewide daily resting losses from equipment for the relevant horsepower tier (tons/day). Obtained from OFFROAD2007.

Diurnal = Statewide daily diurnal losses from equipment for the relevant horsepower tier (tons/day). Obtained from OFFROAD2007.

Hot Soak = Statewide daily hot soak losses from equipment for the relevant horsepower tier (tons/day). Obtained from OFFROAD2007.

Evaporative = Statewide daily evaporative losses from equipment for the relevant horsepower tier (tons/day). Obtained from OFFROAD2007.

Activity = Statewide daily average operating hours for the relevant horsepower tier (hours/day). Obtained from OFFROAD2007.

AvgHP = Average horsepower for the relevant horsepower tier (HP). Obtained from OFFROAD2007.

Hp = Horsepower of TRU.

Hr = Hours of operation.

C = Unit conversion factor

Mitigation Method:

Mitigated emissions for this measure are calculated using the same method as baseline method, but with emission factors from compressed natural gas in OFFROAD2007.

Emission Reduction Ranges and Variables:

GHG and criteria pollutant emission reductions from switching diesel or gasoline fuel to compressed natural gas fuel for different years are listed in accompanying tables. Only equipment with emission data for compressed natural gas and either diesel or gasoline fuel in OFFROAD2007 are included.

Discussion:

The emission changes vary over a large range for different pollutants and equipment and between diesel and gasoline. In fact, GHG emissions for several types of equipment running on gasoline and all equipment running on diesel would increase from switching to compressed natural gas, as reflected by the negative reductions in the tables. On the other hand, SO_2 emissions are 100% reduced as there is no SO_2 emissions from equipment running on compressed natural gas according to OFFROAD2007. Other trends include no significant change in PM emissions for most gasoline equipment, considerable decrease in CO emissions from gasoline equipment but significant increase in CO emissions from diesel equipment. Therefore, the Project Applicant has to weigh the costs and benefits from switching to compressed natural gas on a case-by-case basis.

Assumptions:

Data based upon the following references:

- California Air Resources Board. Off-road Emissions Inventory. OFFROAD2007. Available online at: http://www.arb.ca.gov/msei/offroad/offroad.htm
- California Climate Action Registry (CCAR). 2009. General Reporting Protocol. Version 3.1. Available online at: http://www.climateregistry.org/tools/protocols/general-reporting-protocol.html
  California Climate Action Registry Reporting Online Tool. 2006 PUP Reports. Available online at: https://www.climateregistry.org/CARROT/public/reports.aspx

Preferred Literature:

GHG emissions from the combustion of conventional petroleum diesel and gasoline fuel can be calculated using CARB's OFFROAD model emission factors [1]. The model provides state-wide and regional emission factors that can be converted to grams per horsepower-hour. Multiplying this factor by the typical horsepower of the equipment and the estimated number of hours of operation gives the total GHG emissions. In this mitigation measure, compressed natural gas was chosen as the alternative fuel. Emission factors for compressed natural gas can also be obtained from OFFROAD The

GHG emissions reduction associated with this mitigation measure is therefore the difference in emissions from using petroleum diesel or gasoline versus using compressed natural gas. Other types of alternative fuels besides compressed natural gas exist. In order to take credit for this mitigation measure, the Project Applicant would need to provide detailed and substantial documentation showing expected reductions in GHG emissions as a result of running construction equipment on these alternative fuels rather than petroleum diesel or gasoline. One potential issue with quantifying this mitigation measure is the difference in fuel economy between petroleum diesel and alternative fuels.

Alternative Literature:

Many USDOE, NREL, and USEPA reports exist which present data on exhaust emissions from engines operating with alternative fuels. The majority of these reports focuses on oxides of nitrogen (NOx) and particulate matter (PM) emissions and have limited CO_2 emissions and fuel economy data. One NREL report shows CO_2 emissions and fuel economy for three ethanol/diesel blends (7.7%, 10%, and 15%) in three off-road engines (6.8, 8.1, and 12.5 L) and compares the results to engine performance using conventional diesel fuel [5]. However, this report presented engine-specific data from a small study size. Issues with other reports include the study's focus on on-road engines rather than off-road engines which would be used in construction equipment. It would be difficult to generalize the data contained in these reports for a Project Applicant's ease of use.

8.1.2 Use Electric and Hybrid Construction Equipment

Range of Effectiveness: 2.5 – 80% of GHG emissions from equipment that is electric or hybrid if used 100% of the time

Measure Description:

When construction equipment is powered by grid electricity rather than fossil fuel, direct GHG emissions from fuel combustion are replaced with indirect GHG emissions associated with the electricity used to power the equipment. When construction equipment is powered by hybrid-electric drives, GHG emissions from fuel combustion are reduced.

Measure Applicability:

- Construction vehicles

Inputs:

The following information needs to be provided by the Project Applicant:

- Electricity provider for the Project
- Fuel type and Horsepower of Construction Equipment
- Hours of operation

Baseline Method:

$$\text{Baseline Emission} = EF \times Hp \times LF \times Hr \times C$$

Where:

Emission = MT CO_2e or MT Criteria Pollutant
EF = Emission factor for the relevant fuel horsepower tier (g/hp-hr). Obtained from OFFROAD2007. See accompanying tables
Hp = Horsepower of equipment.
LF = Load factor of equipment for the relevant horsepower tier (dimensionless). Obtained from OFFROAD2007.
Hr = Hours of operation.
C = Unit conversion factor

Mitigation Method:

<u>Fully Electric Vehicle</u>

Construction vehicles will run solely on electricity. The indirect GHG emission from electricity generation is:

$$\text{Mitigated GHG Emission} = Utility \times Hp \times LF \times Hr \times C$$

Where:

GHG emissions = MT CO_2e
Utility = Carbon intensity of Local Utility (CO_2e/kWh)
Hp = Horsepower of equipment.
LF = Load factor of equipment for the relevant horsepower tier (dimensionless). Obtained from OFFROAD2007.
Hr = Hours of operation.
C = Unit conversion factor

Criteria pollutant emissions will be 100% reduced for equipment running solely on electricity.

GHG Reduction %[106] $= 1 - \frac{\text{Utility} \times C}{EF \times 10^{-6}}$

Hybrid-Electric Vehicle

GHG Reduction % = Percent Reduction in Fuel Consumption

Emission Reduction Ranges and Variables:

Fully Electric Vehicle

GHG

Utility	Diesel	Compressed Natural Gas 4-strokes	Gasoline 2-strokes	Gasoline 4-strokes				
				<25 HP	25-50 HP	50-120 HP	120-175 HP	175-500 HP
LADW&P	26.3%	37.9%	2.5%	2.5%	46.5%	45.9%	44.4%	42.8%
PG&E	72.9%	77.1%	64.1%	64.1%	80.3%	80.1%	79.5%	78.9%
SCE	61.8%	67.9%	49.5%	49.5%	72.3%	72.0%	71.2%	70.4%
SDGE	53.5%	60.9%	38.5%	38.5%	66.3%	65.9%	64.9%	63.9%
SMUD	67.0%	72.2%	56.3%	56.3%	76.0%	75.8%	75.1%	74.3%

Criteria pollutant

Emissions will be 100% reduced for equipment running on electricity.

Hybrid-Electric Vehicle

GHG

The Project Applicant has to determine the fuel consumption reduced from using the hybrid-electric vehicle. The emission reductions for all pollutants are the same as the fuel reduction.

[106] This assumes energy from engine losses are the same.

Discussion:

The CO_2 emission factor show in the accompanying tables obtained from OFFROAD2007 [1] shows the same emissions within each horsepower tier regardless of the scenario year or equipment model year. The contributions of CH_4 and N_2O to overall GHG emissions is likely small (< 1% of total CO_2e) from diesel construction equipment [2] and were therefore not included. Therefore, the CO_2e emission reduction is dependent on the electricity provider for the Project, horsepower and fuel of the construction equipment only.

On the other hand, the criteria pollutant emission factors from OFFROAD2007 vary for different scenario and equipment model years. The criteria pollutant emission factors presented in the accompanying tables correspond to those of new equipment in the respective scenario years, i.e., model year is the same as scenario year. Since older equipment have higher emission factors due to deterioration and less regulation, the emission reduction calculated from this methodology is likely to be an underestimate.

Assumptions:

Data based upon the following references:

Preferred Literature:

Electric construction equipment is available commercially from companies such as Peterson Pacific Corporation and Komptech USA, which specialize in the mechanical processing equipment like grinders and shredders [4,5]. The amount of direct GHG emissions avoided can be calculated using CARB's OFFROAD2007 model, which provides state-wide and regional emission factors for a variety of construction equipment that can be converted to grams per horsepower-hour [6]. Multiplying this factor by the number of hours of operation gives the direct GHG emissions. Assuming the same number of operating hours as the diesel-powered equipment, the electricity required to run a piece of electric construction equipment can be calculated by multiplying the operating hours by the amperage required to run the equipment and the voltage rating (obtained from manufacturer technical specifications) to obtain total kWh required. Multiplying this value by the carbon-intensity factor of the local utility gives the amount of indirect GHG emissions associated with using the electric equipment. The

GHG emissions reduction associated with this mitigation measure is therefore the difference in emissions from these two scenarios.

Construction equipment powered by hybrid-electric drives is also commercially available from companies such as Caterpillar [7]. For example, Caterpillar reports that during an 8-hour shift, its D7E hybrid dozer burns 19.5% fewer gallons of fuel than a conventional dozer while achieving a 10.3% increase in productivity. The D7E model burns 6.2 gallons per hour compared to a conventional dozer which burns 7.7 gallons per hour. The percent reduction in fuel use is directly proportional to the percent reduction in GHG emissions. Assuming complete combustion to CO_2 and a carbon content of 87%, the CO_2 emissions reductions can be calculated. Fuel usage and savings are dependent on the make and model of the construction equipment used. The Project Applicant should calculate project-specific savings and provide manufacturer specifications indicating fuel burned per hour.

8.1.3 Limit Construction Equipment Idling beyond Regulation Requirements

Range of Effectiveness: Varies with the amount of Project Idling occurring and the amount reduced.

Measure Description:

Heavy duty vehicles will idle during loading/unloading and during layovers or rest periods with the engine still on. Idling requires fuel use and results in emissions. The California Air Resources Board (CARB) Heavy-Duty Vehicle Idling Emission Reduction Program limits diesel-fueled commercial motor vehicles idling time to 5 minutes. There are some exceptions to the regulation such as positioning or providing a power source for equipment or operations such as lift, crane, pump, drill, hoist or other auxiliary equipment. Reduction in idling time beyond required under the regulation would further reduce fuel consumption and thus emissions. The project applicant should develop an enforceable mechanism that monitors the idling time to ensure compliance with this mitigation measure.

Measure Applicability:

- Heavy Duty Commercial Vehicles

Inputs:

The following information needs to be provided by the Project Applicant:

- Idling time of vehicle

Baseline Method:

For all pollutants, the idling emission from each idling period is calculated as follows:

$$\text{Emission} = EF \times t \times C$$

Where:

Emission = grams of pollutant per idling period

EF = Idling emission factor for diesel-fueled heavy duty vehicles obtained from EMFAC (g/idling-hour).

t = Baseline idling period (minute). This is 5 minutes for all vehicles which do not have auxiliary equipment powered by the primary engine exempted from the regulation. For exempted vehicles, the Project applicant shall determine the baseline idling period.

C = Time conversion factor = 1/60

Mitigation Method:

Mitigated emissions for this measure are calculated using the same method as baseline method, but with mitigated idling period.

Emission Reduction Ranges and Variables:

Emission reduction is calculated as follows:

$$\text{Reduction} = 1 - \frac{t_M}{t_B}$$

Where:

t_M = mitigated idling period
t_B = baseline idling period

Discussion:

If a heavy duty truck is regulated under the CARB Idling Emission Reduction Program, and the Project Applicant has committed to enforce a reduced idling period to 3 minutes, then the emissions for all pollutants from idling emissions would be reduced by:

$$1 - \frac{3}{5} = 0.4 = 40\%$$

If the Project Applicant determines that the average idling period for a heavy duty vehicle with a hoist powered by the primary engine is 20 minutes, and has committed to enforce a reduced idling time to 15 minutes, then the emissions for all pollutants would be reduced by:

$$1 - \frac{15}{20} = 0.25 = 25\%$$

Assumptions:

Data based upon the following references:

- California Air Resources Board (CARB) 2009. Heavy-Duty Vehicle Idling Emission Reduction Program. Available at: http://www.arb.ca.gov/msprog/truck-idling/truck-idling.htm
- CARB 2010. EMFAC2007 Model. Available at: http://www.arb.ca.gov/msei/onroad/latest_version.htm

Preferred Literature:

Idling of heavy duty commercial vehicles requires fuel use and results in emissions. Project Applicant can obtain the average idling emission factor for diesel-fueled heavy duty trucks in the county where the Project would be located from EMFAC. The total idling emissions can be determined by multiplying this emission factor by the total idling period. The California Air Resources Board (CARB) Heavy-Duty Vehicle Idling Emission Reduction Program limits diesel-fueled commercial motor vehicles idling time to 5 minutes, with exceptions for some vehicles with auxiliary equipment powered by the primary engine [1]. The Project Applicant has to determine the appropriate baseline idling periods for such exempted vehicles. A plan should also be developed to ensure enforcement of the reduced idling period that the Project Applicant has committed to.

8.1.4 Institute a Heavy-Duty Off-Road Vehicle Plan

Range of Effectiveness:

Not applicable on its own. This measure ensures compliances with other mitigation measures.

Measure Description:

The Project Applicant should provide a detailed plan that discusses a construction vehicle inventory tracking system to ensure compliances with construction mitigation measures. The system should include strategies such as requiring hour meters on equipment, documenting the serial number, horsepower, manufacture age, fuel, etc. of all onsite equipment and daily logging of the operating hours of the equipment.

Measure Applicability:

- This measure ensures compliances with other mitigation measures.
- Construction vehicles.

Preferred Literature:

None

9.0 Miscellaneous

9.1 Miscellaneous

9.1.1 Establish a Carbon Sequestration Project

Range of Effectiveness: Varies depending on Project Applicant and projects selected. The GHG emissions reduction is subtracted from the overall baseline project emissions inventory.

Measure Description:
The Project Applicant would establish a carbon sequestration project. This might include (a) geologic sequestration or carbon capture and storage techniques in which CO_2 from point sources such as power plants and fuel processing plants is captured and injected underground, (b) terrestrial sequestration in which ecosystems such as wetlands and forestlands are established or preserved to serve as CO_2 sinks, (c) novel techniques involving advanced chemical or biological pathways, or (d) technologies yet to be discovered. The Project Applicant would commit to a desired amount of carbon sequestration in MT per year. This amount would be subtracted from the overall baseline project emissions inventory. In order to take credit for this measure, the Project Applicant should be required to establish a reporting and verification mechanism to quantify the amount of carbon sequestered. Furthermore, the Project Applicant should be required to prove additionality.[107]

Measure Applicability:
- Overall baseline project GHG emissions inventory

Inputs:
- Amount of CO_2e sequestered (MT/year)

Baseline Method:
The Project Applicant should calculate the baseline project emissions inventory ($CO_2e_{baseline}$, the total baseline CO_2e emissions in MT per year) using the methods described in the baseline methodology document.

Mitigation Method:
The amount of CO_2e sequestered is subtracted from the overall project emissions inventory. Therefore, the percent GHG reduction is

---

[107] Additionality is the reduction in emissions by sources or enhancement of removals by sinks that is additional to any that would occur in the absence of the Project. In other words, the Project should not subsidize or take credit for emissions reductions which would have occurred regardless of the Project.

Miscellaneous

MP# **LU-5**

Misc-1

Carbon Sequestration

GHG emission reduction $= \dfrac{CO_2e_{sequestered}}{CO_2e_{baseline}}$

Where:

GHG emission reduction	=	Percentage reduction in overall GHG emissions from carbon sequestration project
$CO_2e_{sequestered}$	=	Amount of CO_2e sequestered (MT/year) Provided by Applicant
$CO_2e_{baseline}$	=	Total baseline CO_2e emissions (MT/year)

Assumptions:
Data based upon the following references:

- USDOE. Fossil Energy: Carbon Sequestration. Available online at: http://www.fossil.energy.gov/programs/sequestration/

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	To be determined by Applicant
All other pollutants	None

Preferred Literature:
The DOE Fossil Energy – Carbon Sequestration website describes the four core carbon sequestration technologies: geologic, carbon capture and storage, terrestrial, and novel biological and chemical pathways. The DOE website discusses current challenges and research projects associated with each of the carbon sequestration technologies, as well as the trade-offs between local environmental impacts and global environmental benefits.

Alternative Literature:
None

Other Literature Reviewed:
None

9.1.2 Establish Off-Site Mitigation

Range of Effectiveness: Varies depending on Project Applicant and projects selected. The GHG emissions reduction is subtracted from the overall baseline project emissions inventory.

Measure Description:
The Project Applicant may decide to establish GHG reduction measures similar to any of the measures discussed in this report. These reductions would take place outside of the Project Site. In order to take credit for this measure, the Project Applicant should be required to establish a method for registering and verifying the GHG emissions reduction. Furthermore, the Project Applicant should be required to prove additionality.[108]

Measure Applicability:
- Overall baseline project GHG emissions inventory

Inputs:
- Amount of CO_2e reduced off-site (MT/year)

Baseline Method:
The Project Applicant should calculate the baseline project emissions inventory ($CO_2e_{baseline}$, the total baseline CO_2e emissions in MT per year) using the methods described in the baseline methodology document.

Mitigation Method:
The amount of CO_2e reduced off-site is subtracted from the overall project emissions inventory. Therefore, the percent GHG reduction is:

$$\text{GHG emission reduction} = \frac{CO_2e_{\text{reduced off-site}}}{CO_2e_{\text{baseline}}}$$

Where:

GHG emission reduction	=	Percentage reduction in overall GHG emissions from off-site mitigation
$CO_2e_{\text{reduced off-site}}$	=	Amount of CO_2e reduced off-site (MT/year) Provided by Applicant
CO_2e_{baseline}	=	Total baseline CO_2e emissions (MT/year)

[108] Additionality is the reduction in emissions by sources or enhancement of removals by sinks that is additional to any that would occur in the absence of the Project. In other words, the Project should not subsidize or take credit for emissions reductions which would have occurred regardless of the Project.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	To be determined by Applicant
All other pollutants	To be determined by Applicant. Reductions in criteria pollutant emissions may be achieved if the off-site mitigation involves removing or retrofitting combustion sources or reducing electricity use.[109]

Preferred Literature:

None

[109] Note that the reduction in criteria pollutant emissions may not occur in the same air basin as the project.

9.1.3 Use Local and Sustainable Building Materials

Range of Effectiveness: Varies depending on Project Applicant and strategies selected. Best Management Practice.

Measure Description:
Using building materials which are sourced and processed locally (i.e. close to the project site, as opposed to in another state or country) reduces transportation distances and therefore reduces GHG emissions from fuel combustion. Using sustainable building materials, such as recycled concrete or sustainably harvested wood, also contributes to GHG emissions reductions due to the less carbon-intensive nature of the production and harvesting of these materials. Unlike measures which reduce GHG emissions during the operational lifetime of a project, such as reducing building electricity and water usage, these mitigation efforts are realized prior to the actual operational lifetime of a project. Therefore, these GHG emissions are best quantified in terms of a life-cycle analysis. Life cycle analyses examine all stages of the life of a product, including raw material acquisition, manufacture, transportation, installation, use, and disposal or recycling. The Project Applicant should seek local agency guidance on comparing and/or combining operational emissions inventories and life cycle emissions inventories.

Measure Applicability:
- Life cycle emissions from building materials

Inputs:
The following information needs to be provided by the Project Applicant:
- Project location
- Material transport distance
- Material type
- Building assembly type and square footage

Preferred Literature:
Several software packages and web-based tools are available which can be used to quantify the life cycle emissions from building materials.

The Building for Environmental and Economic Sustainability (BEES) software developed by the National Institute of Standards and Technology (NIST) can calculate global warming potential (in terms of CO_2 emissions in grams per product) for a variety of building products, including a multitude of cement varieties, fabrics, tiles, glass, wood, and shelving materials. Required inputs are the type of building material (e.g. generic 100% Portland cement, generic 20% limestone cement), and transportation distance. The user can compare between different types of materials and associated transportation distances.

The BEES software and user manual is available for public download here: http://www.bfrl.nist.gov/oae/software/bees/bees.html

The Athena EcoCalculator for Assemblies software developed by the Athena Institute analyzes the environmental impacts of whole buildings in terms of global warming potential (in terms of CO_2e) from raw material extraction, final material manufacturing, transportation, on-site construction, maintenance, and demolition and disposal. Required inputs include the project location, assembly type (columns and beams, floor, exterior wall, interior wall, window, or roof), type of material, and square footage of material. The Athena EcoCalculator compares CO_2e emissions from the project-specific assembly to default assemblies of similar material and size. The Athena EcoCalculator is based on the more rigorous Athena Impact Estimator software, which requires detailed information about the building design including the number of columns and beams, supported span, wall height, and type of material used for all aspects. In contrast, the Athena EcoCalculator assumes default values for many of the architectural details.

A free public version of the Athena EcoCalculator is available for download here: http://www.athenasmi.org/tools/ecoCalculator/index.html

9.1.4 Require Best Management Practices in Agriculture and Animal Operations

9.1.5 Require Environmentally Responsible Purchasing

Range of Effectiveness: Varies depending on Project Applicant and strategies selected. Best Management Practice.

Measure Description:
Requiring environmentally responsible purchasing has the potential to have a net effect of reducing GHG emissions by reducing the life cycle emissions, operating emissions, and/or transportation emissions associated with a product. Examples of environmentally responsible purchases which reduce life cycle emissions include but are not limited to: purchasing products with sustainable packaging; purchasing post-consumer recycled copier paper, paper towels, and stationary; purchasing and stocking communal kitchens with reusable dishes and utensils; choosing sustainable cleaning supplies; and leasing equipment from manufacturers who will recycle the components at their "end of life." Examples of environmentally responsible purchases which reduce a Project's operating emissions include choosing ENERGY STAR appliances and Water Sense-certified water fixtures; choosing electronic appliances with built in sleep-mode timers; and purchasing "green power" (e.g. electricity generated from renewables or hydropower) from the utility. Choosing locally-made and distributed products reduces the transportation distances required to move the product from the distribution or manufacturing center to the Project, and therefore reduce GHG emissions associated with the transportation vehicles.

Since the magnitude of the energy and GHG reduction depends on the purchasing strategies implemented, the expected GHG reduction is not quantifiable at this time. Therefore, this mitigation measure should be incorporated as a Best Management Practice to encourage homeowners, commercial space tenants, and builders to make sustainable purchases and therefore reduce their contribution to GHG emissions. The Project Applicant could take quantitative credit for this mitigation measure if detailed and substantial evidence were provided.

Measure Applicability:
- Purchase of consumer and business goods and appliances

Assumptions:
Data based upon the following references:

- City of Chicago and ICLEI. Chicago Green Office Challenge: Waste. Available online at: http://www.chicagogreenofficechallenge.org/pages/waste/50.php
- Cool California.org. Small Business Money Saving Actions: Recycle and Cut Waste. Available online at: http://www.coolcalifornia.org/article/recycle-and-cut-waste

- Flex Your Power.org. Commercial Overview Energy Saving Tips: Office Equipment Tips. Available online at: http://www.fypower.org/com/tools/energy_tips_results.html?tips=office
- ENERGY STAR. 2007. Putting Energy into Profits: ENERGY STAR Guide for Small Businesses. Available online at: http://www.energystar.gov/ia/business/small_business/sb_guidebook/smallbizguide.pdf

Emission Reduction Ranges and Variables:
This is a Best Management Practice and therefore at this time there is no quantifiable reduction. Check with local agencies for guidance on any allowed reductions associated with implementation of best management practices.

Preferred Literature:
The Chicago Green Office Challenge, Cool California.org, and Flex Your Power.org website resources provide many examples of office and small business purchasing strategies which reduce waste and energy use. The ENERGY STAR Guide provides more details about energy-efficient appliance choices and the option to purchase renewable or clean energy from the utility for a higher cost.

9.1.6 Implement an Innovative Strategy for GHG Mitigation

Range of Effectiveness: Varies depending on Project Applicant and strategies selected. The GHG emissions reduction may be quantifiable. If not quantifiable, this mitigation measure should be implemented as a Best Management Practice.

Measure Description:
The Project Applicant may develop a novel strategy to reduce GHG emissions at the project site or off-site. This strategy may incorporate technologies which have yet to be developed at the time of the publication of this report. In order to take quantifiable credit for this measure, the Project Applicant must provide detailed and substantial evidence showing the quantification and verification of the GHG emissions reduction. If the GHG emissions reduction is not quantifiable, it should be implemented as a Best Management Practice.

Measure Applicability:
- To be determined by Project Applicant

Inputs:
- Amount of CO_2e reduced due to Innovative Strategy
- Baseline CO_2e for applicable inventory sector

Baseline Method:
The Project Applicant should calculate the baseline CO_2e emissions associated with the applicable GHG emissions inventory sector ($CO_2e_{baseline\text{-}sector}$, the baseline CO_2e emissions in MT per year for the applicable sector) using the methods described in the baseline methodology document. For example, if the Innovative Strategy achieves GHG reductions by reducing building energy use, $CO_2e_{baseline\text{-}sector}$ is the total CO_2e emissions associated with baseline building energy use.

Mitigation Method:
The amount of CO_2e reduced due to the Innovative Strategy is subtracted from applicable emissions inventory sector. Therefore, the percent GHG reduction is:

$$\text{GHG emission reduction} = \frac{CO_2e_{reduced\text{-}sector}}{CO_2e_{baseline\text{-}sector}}$$

Where:

GHG emission reduction	=	Percentage reduction in sector GHG emissions due to Innovative Strategy
$CO_2e_{reduced\text{-}sector}$	=	Amount of CO_2e reduced due to Innovative Strategy (MT/year) Provided by Applicant
$CO_2e_{baseline\text{-}sector}$	=	Baseline sector CO_2e emissions (MT/year)

If the GHG emissions reduction cannot be quantified and/or verified, check with local agencies for guidance on any allowed reductions associated with implementation of Best Management Practices.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	To be determined by Applicant
All other pollutants	None

Preferred Literature:

None

10.0 General Plans

In addition to fact sheets and BMPs, this document includes measures that are more applicable for General Plans. The following measures have substantial evidence of reductions when implemented at a General Plan level rather than a project level.

10.1 General Plans

10.1.1 Fund Incentives for Energy Efficiency

Range of Effectiveness: Varies depending on Project Applicant and strategies selected. Best Management Practice.

Measure Description:
By funding incentives for energy-efficient choices in equipment, fixtures in buildings, or energy sources, a Project Applicant can promote reductions in GHG emissions associated with fuel combustion and electricity use. The Project Applicant may choose to contribute to an existing municipal energy fund or establish a new energy fund for the Project. The Project Applicant should check with the local air district regarding participating in established programs. These energy funds may provide financial incentives or grants for any number of energy efficiency measures including but not limited to: retrofitting or designing new buildings, parking lots, streets, and public areas with energy-efficient lighting; retrofitting or designing new buildings with low-flow water fixtures and high-efficiency appliances; retrofitting or purchasing new low-emissions equipment; purchasing electric or hybrid vehicles; and investing in renewable energy systems such as photovoltaics or wind turbines. Recipients of energy fund grants could include neighborhood developers, home and commercial space builders, homeowners, and utilities. Energy funds allow recipients flexibility in choosing efficiency strategies while still achieving the desired effects of reduced energy use and associated GHG emissions.

Since the magnitude of the energy and GHG reduction depends on the strategies selected by the energy fund recipients, the expected GHG reduction is not quantifiable at this time. Therefore, this mitigation measure should be incorporated as a Best Management Practice to encourage utilities, builders, residents, and commercial tenants to reduce their energy use and/or choose cleaner energy, and therefore reduce their contribution to GHG emissions. The Project Applicant could take quantitative credit for this mitigation measure if detailed and substantial evidence were provided.

Measure Applicability:
- GHG emissions from energy use (fuel combustion and electricity use)

Assumptions:
Data based upon the following references:

- City of Ann Arbor. Energy Office: Energy Fund. Available online at: http://www.a2gov.org/government/publicservices/systems_planning/energy/Pages/EnergyFund.aspx
- Go Solar California. California Solar Initiative. Available online at: http://www.gosolarcalifornia.org/csi/index.html
- USDOE. Database of State Initiatives for Renewables and Efficiency: California. Available online at: http://www.dsireusa.org/incentives/index.cfm?re=1&ee=1&spv=0&st=0&srp=1&state=CA
- California Clean Energy Fund. About Us. Available online at: http://www.calcef.org/about.htm

Emission Reduction Ranges and Variables:
This is a Best Management Practice and therefore there is no quantifiable reduction at this time. Check with local agencies for guidance on any allowed reductions associated with implementation of best management practices.

Preferred Literature:
The City of Ann Arbor's Energy Fund provides a good example of a municipal general energy fund which provides grants for a wide variety of energy efficiency and renewable energy investments. The California Solar Initiative and the Energy Efficient Appliance Rebate Program (found on the DOE Database of State Initiatives for Renewables and Efficiency) are examples of California state energy funds which incentivize specific types of purchases. The DOE database provides a listing of many more California municipal and local programs.

10.1.2 Establish a Local Farmer's Market

Range of Effectiveness: Varies depending on Project Applicant and strategies selected. Best Management Practice.

Measure Description:

Establishing a local farmer's market has the potential to reduce greenhouse gas emissions by providing project residents with a more local source of food, potentially resulting in a reduction in the number of trips and vehicle miles traveled by both the food and the consumers to grocery stores and supermarkets. If the food sold at the local farmer's market is produced organically, it can also contribute to greenhouse gas reductions by displacing carbon-intensive food production practices. As discussed in more detail below, these emissions reductions cannot be reasonably quantified at this time because they are based on several undefined parameters: the relative locations of the farmer's market, supermarket, and supermarket produce suppliers; the carbon intensity of food production practices; and the role of the farmer's market in a development, such as whether it supplements trips to the grocery store or completely displaces them.

Measure Applicability:

- Number of trips to supermarket and vehicle miles traveled
- Life cycle emissions of food production

Discussion:

Potential greenhouse gas emissions from establishing a local farmer's market can be divided into two types: emissions reductions from transportation and emissions reductions from food production practices. The transportation of food from a field to a store and the transportation of consumers from their homes to a store both contribute to greenhouse gas emissions. In many cases, especially in urban areas, a local farmer's market will reduce emissions associated with the distribution of food from the field to the consumer, since the farms represented at the local farmer's market are theoretically closer to the consumer than the farms which produce most of the food found at supermarkets and grocery stores. However, California has a large number of farms and orchards and in some cases the farms represented at a local farmer's market may not be different than those represented at the neighborhood grocery store. If a consumer obtains produce from a local farmer's market when they would otherwise drive a farther distance to purchase produce from a grocery store, the trip to the grocery stores is displaced, VMT is reduced, and GHG emissions reductions are achieved. However, if a consumer drives to the farmer's market and then to the grocery store (for example, to purchase food which the farmer's market cannot provide), the trip to the farmer's market is made in addition to the trip to the grocery store. Thus, an additional trip is made, VMT is added, and greenhouse gas emissions are actually increased. It is unclear how local farmer's markets affect the food purchasing behavior of consumers, and therefore the effect of a farmer's market on transportation greenhouse gas emissions is not quantifiable at this time. The carbon intensity of food production practices also contributes to greenhouse gas emissions; however, these emissions are accounted for in the life cycle analysis of the food and cannot be directly compared to a development's operational greenhouse gas emissions inventory (such as the transportation emissions detailed above). If food at a local farmer's market is produced organically, it is likely that less carbon-intensive practices were used than at the large-scale farms and orchards which produce most food found at grocery stores and supermarkets. Examples of carbon-intensive gardening practices include heated greenhouses and the heavy use of fertilizers and pesticides derived from fossil fuels. Local farms which do not practice organic or sustainable farming may employ these more carbon-intensive practices. Thus, the magnitude of the life-cycle greenhouse gas emissions is difficult to quantify and compare to operational inventories.

Preferred Literature:

None

10.1.3 Establish Community Gardens

Range of Effectiveness: Varies depending on Project Applicant and strategies selected. Best Management Practice.

Measure Description:

Establishing a community garden has the potential to reduce greenhouse gas emissions by providing project residents with a local source of food, potentially resulting in a reduction in the number of trips and vehicle miles traveled by both the food and the consumers to grocery stores and supermarkets. Community gardens can also contribute to greenhouse gas reductions by displacing carbon-intensive food production practices. As discussed in more detail below, these emissions reductions cannot be reasonably quantified at this time because they are based on several undefined parameters: the relative locations of the community garden, supermarket, and supermarket produce suppliers; the carbon intensity of gardening and farming practices; and the role of a community garden in a development, such as whether it supplements trips to the grocery store or completely displaces them.

Measure Applicability:

- Number of trips to supermarket and vehicle miles traveled
- Life cycle emissions of food production

Discussion:

Potential greenhouse gas emissions from establishing a community garden can be divided into two types: emissions reductions from transportation and emissions reductions from food production practices. The transportation of food from a field to a store and the transportation of consumers from their homes to a store both contribute to greenhouse gas emissions. In most cases a community garden will reduce emissions associated with the distribution of food from the field to the consumer, since with community gardens the food goes directly from the field to the consumer, while in grocery stores and supermarkets the path is more likely field to regional distribution center to store to consumer. If a consumer obtains produce from a community garden when they would otherwise drive a farther distance to purchase produce from a grocery store, the trip to the grocery stores is displaced, VMT is reduced, and GHG emissions reductions are achieved. However, if a consumer drives to the community garden and then to the grocery store (for example, to purchase food which the community garden cannot provide), the trip to the community garden is made in addition to the trip to the grocery store. Thus, an additional trip is made, VMT is added, and greenhouse gas emissions are actually increased. Furthermore, if community gardens displace backyard gardens, they increase transportation emissions. It is unclear how community gardens affect the food purchasing behavior of consumers, and therefore the effect of a community garden on transportation greenhouse gas emissions is not quantifiable at this time. The carbon intensity of food production practices also contributes to greenhouse gas emissions; however, these emissions are accounted for in the life cycle analysis of the food and cannot be directly compared to a development's operational greenhouse gas emissions inventory (such as the transportation emissions detailed above). Community gardens are likely to produce food using less carbon-intensive practices than the large-scale farms and orchards which produce most food found at grocery stores and supermarkets. Examples of carbon-intensive gardening practices include heated greenhouses and the heavy use of fertilizers and pesticides derived from fossil fuels; these practices are not likely to be used at community gardens. Although these qualitative conclusions can be drawn, the magnitude of the life-cycle greenhouse gas emissions is difficult to quantify and compare to operational inventories.

Preferred Literature:

None

10.1.4 Plant Urban Shade Trees

Range of Effectiveness: The reduction in GHG emissions is not quantifiable at this time, therefore this mitigation measure should be implemented as a Best Management Practice. If the study data were updated to account for Title 24 standards, the GHG emissions reductions could be quantified but would vary based on location, building type, and building size.

Measure Description:

Planting shade trees around buildings has been shown to effectively lower the electricity cooling demand of buildings by blocking incident sunlight and reducing heat gain through windows, walls, and roofs. Deciduous trees with large canopies are a desirable choice of shade tree because they provide shade in the warm months and shed their leaves in the winter months to allow sunlight to pass through and warm the building. By reducing cooling demand, shade trees help reduce electricity demand from the local utility and therefore reduce GHG emissions which would otherwise be emitted during the production of that electricity.

A study entitled "Calculating energy-saving potentials of heat-island reduction strategies" conducted by the Lawrence Berkeley National Laboratory (LBNL) Heat Island Group provides a method to quantify reductions in electricity use from planting shade trees around residences, offices, and retail stores. The electricity reductions are based on the LBNL model which assumes 4 shade trees are planted around residences, 8 trees are planted around offices, and 10 trees are planted around retail stores. The LBNL model is also based on electricity use data for two building stocks: Pre-1980 buildings (buildings constructed prior to 1980) and 1980+ buildings (buildings constructed on or after 1980). Other assumptions, including the geometry of the modeled trees and sunlight transmittance, are detailed in Section 2.5 of the study. This mitigation measure describes how to estimate greenhouse gas emissions reductions from planting shade trees based on the LBNL data. Since the model is based on electricity data for Pre-1980 and 1980+ buildings[110] it does not incorporate electricity use improvements due to the California 2001, 2005, or 2008 Title 24 measures. Given that buildings constructed in 2001 or later incorporate Title 24 electricity efficiency improvements, the electricity savings reported in the LBNL study are overestimates of the savings that would actually be achieved for these newer buildings.[111]

---

[110] This data for these buildings is based on U.S. Department of Energy and California Energy Commission studies conducted in 1987 through 2001.

[111] The CEC 2003 Impact Analysis Report estimates a state-average 14.9%-26% savings in electricity use for cooling in residential buildings and 6.7% savings in electricity use for cooling in non-residential

While the electricity savings in the study overestimates savings for newer buildings, the data does show that electricity savings (and associated greenhouse gas emissions savings) from planting shade trees are real. A follow-up study which uses similar methodologies with models updated with the Title 24 standards would provide data which could be used to more accurately quantify electricity savings for new buildings.

Measure Applicability:

- Electricity use
- Limitation: It takes several years for trees to grow to the height necessary to provide shade to a building. Furthermore, without deed restrictions, the presence of shade trees around a building may not be permanent, as a new owner may decide to remove the trees or not replace them if they die.

Inputs:

The following information needs to be provided by the Project Applicant:

- Type of building (residential, office, or retail store)
- Square footage of roof
- Heating Degree Days (HDD) or Cooling Degree Days (CDD) of Project location

Baseline Method:

The CEC Residential Appliance Saturation Survey (RASS) and California Commercial Energy Use Survey (CEUS) datasets can be used to calculate the baseline electricity for building cooling. The data is available for different climate zones in California and electricity use from cooling alone can be extracted. The methodology for using RASS and CEUS to calculate $GHG_{baseline}$ is described in the baseline document.

Mitigation Method:

The electricity savings from reduced cooling demand are based on the location of the building. Table 4 of the LBNL study provides a list of cities and their HDD and CDD values. If a project's location is not listed, the Project Applicant should choose a representative city with climate similar to that of the project. Alternatively, the Project Applicant could determine the HDD and CDD of the project location from local meteorological data.

---

buildings due to the 2005 update to the 2001 Title 24 standards. The CEC 2007 Impact Analysis Report estimates a state-average 19.7%-22.7% savings in overall electricity use for residential buildings and a 8.3% savings in electricity use for cooling in non-residential buildings due to the 2008 update to the 2005 Title 24 standards.

Tables 6 through 16 of the LBNL study show the expected electricity savings (in kWh per 1000 sqft of roof) based on the following parameters:

- Building type (residential, office, or retail store)
- Climate method (HDD or CDD – either can be used)
- Heating method (Gas heated-buildings or electric-heated buildings)

The Project Applicant should select data based on the appropriate parameters above. The entry corresponding to the “Shade tree savings” row and “1980+” column will provide the electricity savings in kWh per 1000 sqft of roof for the specified building type, climate method, and heating method. Note that value is an overestimate of savings for buildings which were manufactured under Title 24 standards.

Then the reduction in GHG emissions is calculated as follows:

$$GHG_{reduction} = SF \times ElecSavings \times Utility$$

Where

$GHG_{reduction}$ = Reduction in GHG emissions from planting shade trees (MT)

SF = Sqft of roof
Provided by Applicant

ElecSavings = Electricity savings (kWh / sqft roof)
From Tables 6 through 16 of LBNL study

Utility = Carbon intensity of local utility (MT CO_2e / kWh)
From Table below

Power Utility	Carbon-Intensity (lbs CO_2e/MWh)
LADW&P	1,238
PG&E	456
SCE	641
SDGE	781
SMUD	555

Therefore:

$$\text{Percent reduction in GHG emissions} = GHG_{reduction} / GHG_{baseline}$$

Since the Utility term is a factor of both $GHG_{reduction}$ and $GHG_{baseline}$, the percent reduction in GHG emissions does not depend on the value of Utility.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	The following emissions reductions reflect the implementation of three heat island reduction strategies (installing reflective roofs, planting shade trees, and using high-albedo pavements) for the 1980+ stock buildings. The reduction from planting shade trees around new buildings is expected to be smaller than the estimate below. Additionally, savings are expected to be smaller for new buildings due to the Title 24 standards. • 20% for residential buildings • 5-12% for office buildings • 10-17% for retail buildings
All other pollutants	Same as above[112]

Assumptions:

Data based upon the following reference:

- H. Akbari, S. Konopacki. Lawrence Berkeley National Laboratory. 2005. Calculating Energy-Saving-Potentials of Heat-Island Reduction Strategies. Journal of Energy Policy. Volume 33, p. 721-756.

Preferred Literature:

The LBNL study conducted by Akbari and Konopacki of the Heat Island Group modeled energy savings from shade trees for residential, office, and retail building types. The model accounted for differences in climate by modeling in a range of heating-degree-days and cooling-degree days, and compared a basecase (building with no external shading) to a mitigated case (building with 4, 8, and 10 shade trees, depending on the building type). However, the study is based on pre-2001 data and does not account for updates to California's Title 24 standards. Furthermore, the model assumes a specific number of shade trees planted at specific orientations.

Alternative Literature:

- CCAR. 2010. Urban Forest Project Protocol Version 1.1. Available online at: http://www.climateactionreserve.org/how/protocols/adopted/urban-forest/current-urban-forest-project-protocol/

Section D.3 of the protocol describes a method to quantify the reductions in cooling and heating demand due to the planting of shade trees. Computer simulations incorporating

[112] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

building, climate, and shading effects were used to calculate the change in unit energy consumption (UEC) on a per tree basis. Total change in energy use is calculated by multiplying the change in UEC per try by the total number of trees. Buildings were modeled in three stocks with similar building characteristics: buildings constructed prior to 1950, buildings constructed between 1950 and 1980, and buildings constructed after 1980. As with the primary reference above, the data does not account for electricity efficiency improvements due to California's Title 24 standards.

10.1.5 Implement Strategies to Reduce Urban Heat-Island Effect

Range of Effectiveness: The reduction in GHG emissions is not quantifiable at this time, therefore this mitigation measure should be implemented as a Best Management Practice. If the study data were updated to account for Title 24 standards, the GHG emissions reductions could be quantified but would vary based on location, building type, and building size.

Measure Description:

The urban heat island effect is the phenomenon in which a metropolitan area is warmer than its surrounding rural areas due to increased land surface which retains heat, such as concrete, asphalt, metal, and other materials found in buildings and pavements. This warming effect causes warmer locations, such as many cities in California, to require more energy for air conditioning and refrigeration than the surrounding rural areas. Higher energy requirements in turn result in higher CO_2 emissions from the generation of this energy.

Three strategies have been shown to have a positive impact on reducing localized temperatures and reducing the electricity demand for building cooling. These strategies are planting urban shade trees, installing reflective roofs, and using light-colored or high-albedo[113] pavements and surfaces. Planting shade trees around buildings and installing reflective roofs have both been found to result in direct electricity savings for buildings. The per building direct electricity savings from planting shade trees is discussed in a separate mitigation measure. Reflective roofs are covered under Title 24 Part 6 and the electricity savings is therefore incorporated in savings due to Title 24. The combination of the three strategies, however, has been shown to have a city-wide effect: a reduction in ambient air temperature. This reduction in air temperature results in buildings requiring less electricity for cooling, and is quantified as indirect savings in electricity use. The savings can be quantified on a per-building basis or on a city-wide basis.

A study entitled “Calculating energy-saving potentials of heat-island reduction strategies” conducted by the Lawrence Berkeley National Laboratory (LBNL) Heat Island Group provides a method to quantify per-building reductions in electricity use from implementing these three strategies on a city-wide scale. In addition, the study reports modeled city-wide electricity savings. The electricity reductions are based on a LBNL model with certain assumptions about the number and orientation of shade trees

[113] The albedo ratio of a surface represents how strongly the surface reflects sunlight. Pavements with higher albedo ratios reflect more sunlight and therefore retain less heat.

and the albedo values of roofs and pavements. Per-building electricity savings are also based on for two building stocks: Pre-1980 buildings (buildings constructed prior to 1980) and 1980+ buildings (buildings constructed on or after 1980).

This mitigation measure describes how to estimate greenhouse gas emissions reductions from implementing heat-island effect reduction strategies as reported in the LBNL study. Since the LBNL model is based on electricity data for Pre-1980 and 1980+ buildings[114] it does not incorporate electricity use improvements due to the California 2001, 2005, or 2008 Title 24 measures. Given that buildings constructed in 2001 or later incorporate Title 24 electricity efficiency improvements, the electricity savings reported in the LBNL study are overestimates of the savings that would actually be achieved for these newer buildings.[115]

While the electricity savings in the study overestimates savings for newer buildings, the data does show that electricity savings (and associated greenhouse gas emissions savings) from planting shade trees are real. A follow-up study which uses similar methodologies with models updated with the Title 24 standards would provide data which could be used to more accurately quantify electricity savings for new buildings.

Measure Applicability:

- Electricity use
- Limitation: It takes several years for trees to grow to the height necessary to provide shade to a building. Furthermore, without deed restrictions, the presence of shade trees around a building may not be permanent, as a new owner may decide to remove the trees or not replace them if they die.
- Limitation: it is assumed that the heat-island effect reduction strategies are implemented on a city-wide scale.

Inputs:

The following information needs to be provided by the Project Applicant:

- Type of building (residential, office, or retail store)
- Square footage of roof

---

[114] This data for these buildings is based on U.S. Department of Energy and California Energy Commission studies conducted in 1987 through 2001.

[115] The CEC 2003 Impact Analysis Report estimates a state-average 14.9%-26% savings in electricity use for cooling in residential buildings and 6.7% savings in electricity use for cooling in non-residential buildings due to the 2005 update to the 2001 Title 24 standards. The CEC 2007 Impact Analysis Report estimates a state-average 19.7%-22.7% savings in overall electricity use for residential buildings and a 8.3% savings in electricity use for cooling in non-residential buildings due to the 2008 update to the 2005 Title 24 standards.

- Heating Degree Days (HDD) or Cooling Degree Days (CDD) of Project location

Baseline Method:

The CEC Residential Appliance Saturation Survey (RASS) and California Commercial Energy Use Survey (CEUS) datasets can be used to calculate the baseline electricity for building cooling. The data is available for different climate zones in California and electricity use from cooling alone can be extracted. The methodology for using RASS and CEUS to calculate $GHG_{baseline}$ is described in the baseline document.

Mitigation Method:

The electricity savings from reduced cooling demand are based on the location of the building. Table 4 of the LBNL study provides a list of cities and their HDD and CDD values. If a project's location is not listed, the Project Applicant should choose a representative city with climate similar to that of the project. Alternatively, the Project Applicant could determine the HDD and CDD of the project location from local meteorological data.

Tables 6 through 16 of the LBNL study show the expected electricity savings (in kWh per 1000 sqft of roof) based on the following parameters:

- Building type (residential, office, or retail store)
- Climate method (HDD or CDD – either can be used)
- Heating method (Gas heated-buildings or electric-heated buildings)

The Project Applicant should select data based on the appropriate parameters above. The entry corresponding to the "Indirect Savings" row and "1980+" column will provide the electricity savings in kWh per 1000 sqft of roof for the specified building type, climate method, and heating method. Note that value is an overestimate of savings for buildings which were manufactured under Title 24 standards.

Then the reduction in GHG emissions is calculated as follows:

$$GHG_{reduction} = SF \times ElecSavings \times Utility$$

Where

$GHG_{reduction}$	=	Reduction in GHG emissions from implementing heat island effect reduction strategies on a city-wide scale (MT)
SF	=	Sqft of roof Provided by Applicant
ElecSavings	=	Electricity savings (kWh / sqft roof) From Tables 6 through 16 of LBNL study
Utility	=	Carbon intensity of local utility (MT CO_2e / kWh)

CEQA# **MM E-8 & E-12**
MP# **LU-6.1**

GP-5

From Table below

Power Utility	Carbon-Intensity (lbs CO_2e/MWh)
LADW&P	1,238
PG&E	456
SCE	641
SDGE	781
SMUD	555

Therefore:

$$\text{Percent reduction in GHG emissions} = GHG_{reduction} / GHG_{baseline}$$

Since the Utility term is a factor of both $GHG_{reduction}$ and $GHG_{baseline}$, the percent reduction in GHG emissions does not depend on the value of Utility.

City-Wide GHG reductions
The LBNL study estimates that city-wide reductions in electricity use (and associated GHG emissions) range from about 10-20%. This range is based on the percent indirect savings modeled for five pilot cities: Houston, Baton Rouge, Chicago, Sacramento, and Salt Lake City, as reported in Figure 2 of the LBNL study.

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions
CO_2e	The following per-building emissions reductions reflect the implementation of three heat island reduction strategies (installing reflective roofs, planting shade trees, and using high-albedo pavements) for the 1980+ stock buildings. Actual savings are expected to be lower for new buildings due to the Title 24 standards. • 20% for residential buildings • 5-12% for office buildings • 10-17% for retail buildings
All other pollutants	Same as above[116]

[116] Criteria air pollutant emissions may also be reduced due to the reduction in energy use; however, the reduction may not be in the same air basin as the project.

Assumptions:

Data based upon the following reference:

- H. Akbari, S. Konopacki. Lawrence Berkeley National Laboratory. 2005. Calculating Energy-Saving-Potentials of Heat-Island Reduction Strategies. Journal of Energy Policy. Volume 33, p. 721-756.
- S. Konopacki, H. Akbari. Lawrence Berkeley National Laboratory. 2000. Energy Savings Calculations for Heat Island Reduction Strategies in Baton Rouge, Sacramento, and Salt Lake City. LBNL 42890.

Preferred Literature:

The LBNL study conducted by Akbari and Konopacki of the Heat Island Group modeled energy savings from shade trees for residential, office, and retail building types. The model accounted for differences in climate by modeling in a range of heating-degree-days and cooling-degree days, and compared a basecase (building with no external shading) to a mitigated case (building with 4, 8, and 10 shade trees, depending on the building type). However, the study is based on pre-2001 data and does not account for updates to California's Title 24 standards. Furthermore, the model assumes a specific number of shade trees planted at specific orientations.

yr	year

Glossary of Terms

Alternative Calculation Method
Software used to demonstrate compliance with the California Building Energy Efficiency Standards (Title 24). The software must comply with the requirements listed in the Alternative Calculation Method Approval Manual.

Additionality[a]
The reduction in emissions by sources or enhancement of removals by sinks that is additional to any that would occur in the absence of the project. The project should not subsidize or take credit for emissions reductions which would have occurred regardless of the project.

Albedo[a]
The fraction of solar radiation reflected by a surface or object, often expressed as a ratio or fraction. Snow covered surfaces have a high albedo; the albedo of soils ranges from high to low; vegetation covered surfaces and oceans have a low albedo. The Earth's albedo varies mainly through varying cloudiness, snow, ice, leaf area, and land cover changes. Paved surfaces with high albedos reflect solar radiation and can help reduce the urban heat island effect.

Below Market Rate Housing
Housing rented at rates lower than the market rate. Below market rate housing is designed to assist lower-income families. When below market rate housing is provided near job centers or transit, it provides lower income families with desirable job/housing match or greater opportunities for commuting to work through public transit.

Biochemical Oxygen Demand
Represents the amount of oxygen that would be required to completely consume the organic matter contained in wastewater through aerobic decomposition processes. Under the same conditions, wastewater with higher biochemical oxygen demand (BOD) concentrations will generally yield more methane than wastewater with lower BOD concentrations. BOD_5 is a measure of BOD after five days of decomposition.

Biogenic Emissions[b]
Carbon dioxide emissions produced from combusting a variety of biofuels, such as biodiesel, ethanol, wood, wood waste and landfill gas.

Carbon Dioxide Equivalent
A measure for comparing carbon dioxide with other greenhouse gases. Tonnes carbon dioxide equivalent is calculated by multiplying the tonnes of a greenhouse gas by its associated global warming potential.

California Environmental Quality Act
A statute passed in 1970 that requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible.

Carbon Neutral Power
A power generation system which has net zero carbon emissions. Examples of existing carbon neutral power systems are photovoltaics, wind turbines, and hydropower systems.

Carbon Sink
Any process or mechanism that removes carbon dioxide from the atmosphere. A forest is an example of a carbon sink, because it sequesters carbon dioxide from the atmosphere.

"Carrot"
The purpose of a carrot is to provide an incentive which encourages a particular action. Parking cash-out would be considered a "carrot" since the employee receives a monetary incentive for not driving to work, but is not punished for maintaining status quo.

Combined Heat and Power
Also known as cogeneration. Combined heat and power is the generation of both heat and electricity from the same process, such as combustion of fuel, with the purpose of utilizing or selling both simultaneously. In combined heat and power systems, the thermal energy byproducts of a process are captured and used, where they would be wasted in a separate heat and power system. Examples of combined heat and power systems include gas turbines, reciprocating engines, and fuel cells.

Compact Infill
A Project which is located within or contiguous with the central city. Examples may include redevelopment areas, abandoned sites, or underutilized older buildings/sites.

Climate Zone
Geographic area of similar climatic characteristics, including temperature, weather, and other factors which affect building energy use. The California Energy Commission identified 16 Forecasting Climate Zones (FCZs) for use in the CEUS and RASS analyses. The designation of these FCZs was based in part on the utility service area.

Cordon Pricing
Tolls charged for entering a particular area (a "cordon"), such as a downtown.

Density
The amount of persons, jobs, or dwellings per unit of land area. This is an important metric for determining traffic-related parameters.

Destination Accessibility
A measure of the number of jobs or other attractions reachable within a given travel time. Destination accessibility tends to be highest at central locations and lowest at peripheral ones.

Efficacy
The capacity to produce a desired effect.

ENERGY STAR
A joint program of the U.S. Environmental Protection Agency and the U.S. Department of Energy which sets national standards for energy efficient consumer products. ENERGY STAR certified products are guaranteed to meet the efficiency standards specified by the program.

Elasticity
The percentage change of one variable in response to a percentage change in another variable. Elasticity = percent change in variable A / percent change in variable B (where the

change in B leads to the change in A). For example, if the elasticity of VMT with respect to density is -0.12, this means a 100% increase in density leads to a 12% decrease in VMT.

Evapotranspiration[c]
The loss of water from the soil both by evaporation and by transpiration from the plants growing in the soil.

General Plan
A set of long-term goals and policies that guide local land use decisions. The 2003 *General Plan Guidelines* developed by the California Office of Planning and Research provides advice on how to write a general plan that expresses a community's long-term vision, fulfills statutory requirements, and contributes to creating a great community.

Global Warming Potential[b]
The ratio of radiative forcing that would result from the emission of one kilogram of a greenhouse gas to that from the emission of one kilogram of carbon dioxide over a fixed period of time.

Graywater
Non-drinkable water that can be collected and reused onsite for irrigation, flushing toilets, and other purposes. This water has not been processed through a waste water treatment plant.

Greenhouse Gas
For the purposes of this report, greenhouse gases are the six gases identified in the Kyoto Protocol: carbon dioxide (CO_2), nitrous oxide (N_2O), methane (CH_4), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6).

Headway
The amount of time (in minutes) that elapses between two public transit vehicles servicing a given route and given line. Headways for buses and rail are generally shorter during peak periods and longer during off-peak periods. Headway is the inverse of frequency (headway = 1/frequency), where frequency is the number of arrivals over a given time period (i.e. buses per hour).

Intelligent Transportation System
A broad range of communications-based information and electronics technologies integrated into transportation system infrastructure and vehicles to relieve congestion and improve travel safety.

Job Center
An area with a high degree and density of employment.

Kilowatt Hour
A unit of energy. In the U.S., the kilowatt hour is the unit of measure used by utilities to bill consumers for energy use.

Land Use Index
Measures the degree of land use mix of a development. An index of 0 indicates a single land use while 1 indicates a full mix of uses.

Lumen
A unit of luminous flux. A measure of the brilliance of a source of visible light, or the power of light perceived by the human eye.

Master Planned Community
Large communities developed specifically incorporating housing, office parks, recreational area, and commercial centers within the community. Master planned communities tend to encompass a large land area with the intent of being self-sustaining. Many master planned communities may have lakes, golf courses, and large parks.

Mixed Use
A development that incorporates more than one type of land use. For example, a small mixed use development may have buildings with ground-floor retail and housing on the floors above. A larger mixed use development will locate a variety of land uses within a short proximity of each other. This may include integrating office space, shopping, parks, and schools with residential development. The mixed-use development should encourage walking and other non-auto modes of transport from residential to office/commercial/institutional locations (and vice versa).

Ordinance
A local law usually found in municipal code.

Parking Spillover
A term used to describe the effects of implementing a parking management strategy in a sub-area that has unintended consequences of impacting the surrounding areas. For example, assume parking meters are installed on all streets in a commercial/retail block with no other parking strategies implemented. Customers will no longer park in the metered spots and will instead “spillover” to the surrounding residential neighborhoods where parking is still unrestricted.

Photovoltaic[c]
A system that converts sunlight directly into electricity using cells made of silicon or other conductive materials (solar cells). When sunlight hits the cells, a chemical reaction occurs, resulting in the release of electricity.

Recycled Water
Non-drinkable water that can be reused for irrigation, flushing toilets, and other purposes. It has been processed through a wastewater treatment plant and often needs to be redistributed.

Ride Sharing
Any form of carpooling or vanpooling where additional passengers are carried on the trip. Ride-sharing can be casual and formed independently or be part of an employer program where assistance is provided to employees to match up commuters who live in close proximity of one another.

Renewable Energy[a]
Energy sources that are, within a short time frame relative to the Earth's natural cycles, sustainable, and include non-carbon technologies such as solar energy, hydropower, and wind, as well as carbon-neutral technologies such as biomass.

Self Selection
When an individual selects himself into a group.

Separate Heat and Power
The typical system for acquiring heat and power. Thermal energy and electricity are generated and used separately. For example, heat is generated from a boiler while electricity is acquired from the local utility. Separate heat and power systems are used as the baseline of comparison for combined heat and power systems.

Sequestration[a]
The process of increasing the carbon content of a carbon reservoir other than the atmosphere. Biological approaches to sequestration include direct removal of carbon dioxide from the atmosphere through afforestation, reforestation, and practices that enhance soil carbon in agriculture. Physical approaches include separation and disposal of carbon dioxide from flue gases or from processing fossil fuels to produce hydrogen- and carbon dioxide-rich fractions and longterm storage in underground in depleted oil and gas reservoirs, coal seams, and saline aquifers.

"Stick"
The purpose of a stick is to establish a penalty for a status quo action. Workplace parking pricing would be considered a "stick" since the employee is now monetarily penalized for driving to work.

Suburban
An area characterized by dispersed, low-density, single-use, automobile dependent land use patterns, usually outside of the central city (a suburb).

Suburban Center
The suburban center serves the population of the suburb with office, retail and housing which is denser than the surrounding suburb.

Title 24
Title 24 Part 6 is also known as the California Building Energy Efficiency Standard, which regulates building energy efficiency standards. Regulated energy uses include space heating and cooling, ventilation, domestic hot water heating, and some hard-wired lighting. Title 24 determines compliance by comparing the modeled energy use of a 'proposed home' to that of a minimally Title 24 compliant 'standard home' of equal dimensions. Title 24 focuses on building energy efficiency per square foot; it places no limits upon the size of the house or the actual energy used per dwelling unit. The current Title 24 standards were published in 2008.

Transit-Oriented Development
A development located near and specifically designed around a rail or bus station. Proximity alone does not characterize a development as transit-oriented. The development and surrounding neighborhood should be designed for walking and bicycling and parking management strategies should be implemented. The development should be located within a short walking distance to a high-quality, high frequency, and reliable bus or rail service.

Transportation Demand Management
Any transportation strategy which has an intent to increase the transportation system efficiency and reduce demand on the system by discouraging single-occupancy vehicle travel and encouraging more efficient travel patterns, alternative modes of transportation such as walking, bicycling, public transit, and ridesharing. TDM measures should also shift travel patterns from peak to off-peak hours and shift travel from further to closer destinations.

Transit Ridership
The number of passengers who ride in a public transportation system, such as buses and subways.

Tree and Grid Network
Describes the layout of streets within and surrounding a project. Streets that are characterized as a tree network actually look like a tree and its branches. Streets are not laid out in any uniform pattern, intersection density is low, and the streets are less connected. In a grid network, streets are laid out in a perpendicular and parallel grid pattern. Streets tend to intersect more frequently, intersection density is higher, and the streets are more connected.

Urban
An area which is located within the central city with higher density of land uses than you would find in the suburbs. It may be characterized by multi-family housing and located near office and retail.

Urban Heat Island Effect
The phenomenon in which a metropolitan area is warmer than its surrounding rural areas due to increased land surface which retains heat, such as concrete, asphalt, metal, and other materials found in buildings and pavements.

Vehicle Miles Traveled
The number of miles driven by vehicles. This is an important traffic parameter and the basis for most traffic-related greenhouse gas emissions calculations.

Vehicle Occupancy
The number of persons in a vehicle during a trip, including the driver and passengers.

Contents

1 Introduction

ENVIRON International Corporation (ENVIRON) and Fehr & Peers worked with the California Air Pollution Control Officers Association (CAPCOA) to quantify reductions associated with greenhouse gas (GHG) mitigation measures that can be applied to California Environmental Quality Act (CEQA) Environmental Impact Report (EIR) analyses. The first part of this overall task defines a standard approach to calculate the baseline emissions before mitigation. This report contains the recommendations for methodologies and approaches to assess the baseline GHG emissions.

This report and its methodologies form the basis for the subsequent tasks associated with quantification of GHG mitigation measures. To the extent possible, default values are included with this report and in the mitigation measure Fact Sheets.

This report presents methods to be used to calculate short-term and one-time emissions sources as well as emissions that will occur annually after construction (operational emissions). The one-time emission sources include changes in carbon sequestration due to vegetation changes and emissions associated with construction. The annual operational emissions include the emissions associated with building energy use including natural gas and electricity, emissions associated with mobile sources, emissions associated with water use and wastewater treatment, emissions associated with area sources such as natural gas fired hearths , landscape maintenance equipment, swimming pools, and golf courses.

2 GHG Equivalent Emissions

The term "GHGs" includes gases that contribute to the greenhouse effect, such as carbon dioxide (CO_2,) methane (CH_4), and nitrous oxide (N_2O), as well as gases that are only man-made and that are emitted through the use of modern industrial products, such as hydrofluorocarbons (HFCs), chlorinated fluorocarbons (CFCs), and sulfurhexafluoride (SF_6). These last three families of gases, while not naturally present in the atmosphere, have properties that also cause them to trap infrared radiation when they are present in the atmosphere, thus making them GHGs. These six gases comprise the major GHGs that are recognized by the Kyoto Accords (water is not included).[1] There are other GHGs that are not recognized by the Kyoto Accords, due either to the smaller role that they play in climate change or the uncertainties surrounding their effects. Atmospheric water vapor is not recognized by the Kyoto Accords because there is not an obvious correlation between water concentrations and specific human activities. Water appears to act in a positive feedback manner; higher temperatures lead to higher water vapor concentrations in the atmosphere, which in turn can cause more global warming.[2] California has recently recognized nitrogen trifluoride as another regulated greenhouse gas.

---

[1] This Kyoto Protocol sets legally binding targets and timetables for cutting the greenhouse gas emissions of industrialized countries. The US has not approved the Kyoto treaty.

[2] From the IPCC Third Assessment Report: http://www.grida.no/climate/ipcc_tar/wg1/143.htm and http://www.grida.no/climate/ipcc_tar/wg1/268.htm

Residents and the employees and patrons of commercial and municipal buildings and services use electricity, heating, water, and are transported by motor vehicles. These activities directly or indirectly emit GHGs. The most significant GHG emissions resulting from such residential and commercial developments are emissions of carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O). GHG emissions are typically measured in terms of MT of CO_2 equivalents (CO_2e), calculated as the product of the mass emitted of a given GHG and its specific global warming potential (GWP).

The effect that each of these gases can have on global warming is a combination of the mass of their emissions and their global warming potential (GWP). GWP indicates, on a MT for MT basis, how much a gas is predicted to contribute to global warming relative to how much warming would be predicted to be caused by the same mass of CO_2. CH_4 and N_2O are substantially more potent GHGs than CO_2, with GWPs of 21 and 310, respectively according to the IPCC's Second Assessment Report (SAR).[3] In emissions inventories, GHG emissions are typically reported in terms of pounds (lbs) or MT[4] of CO_2 equivalents (CO_2e). CO_2e are calculated as the product of the mass emitted of a given GHG and its specific GWP. While CH_4 and N_2O have much higher GWPs than CO_2, CO_2 is emitted in such vastly higher quantities that it accounts for the majority of GHG emissions in CO_2e, both from developments and human activity in general. Since most regulatory agencies and protocols use the SAR GWP values as a basis, this assessment will also use SAR GWP values even though more recent values exist. However, SAR did not consider nitrogen trifluoride, however there are no sources of nitrogen trifluoride that would typically need to be quantified.

3 Units of measurement: MT of CO_2 and CO_2e

In many sections of this report, including the final summary sections, emissions are presented in units of CO_2e either because the GWPs of CH_4 and N_2O were accounted for explicitly, or the CH_4 and N_2O are assumed to contribute a negligible amount of GWP when compared to the CO_2 emissions from that particular emissions category.

Emissions and reductions are calculated in terms of metric tons. As such, "MT" will be used to refer to metric tons (1,000 kilograms). "Tons" will be used to refer to short tons (2,000 pounds [lbs]).

4 Indirect GHG Emissions from Electricity Use

As noted above, indirect GHG emissions are created as a result of electricity use. When electricity is used in a building, the electricity generation typically takes place offsite at the power plant; electricity use in a building generally causes emissions in an indirect manner. The project should use information specific for each local utility provider for different parts of

[3] GWP values from IPCC's Second Assessment Report (SAR, 1996) are still used by international convention and are used in this protocol, even though more recent (and slightly different) GWP values were developed in the IPCC's Fourth Assessment Report (FAR, 2007)

[4] In this report, "MT" will be used to refer to metric MT (1,000 kilograms). "Tons" will be used to refer to short tons (2,000 pounds).

California. Accordingly, indirect GHG emissions from electricity usage are calculated using the utility specific carbon-intensity factor based Power/Utility Protocol (PUP) report from California Climate Action Registry (CCAR)[5] for the 2006 baseline year. ENVIRON does not recommend using the 2004 PUP reports since this year was one of the first year's utilities reported emissions, as such, the data is likely less accurate than subsequent years since utilities had a chance to refine data collection methods for the later years. Furthermore, a large coal burning power plant in Mojave was going offline in 2005 which was factored into the Scoping Plan analysis. Therefore, ENVIRON suggests using the 2006 PUP reports since it likely represents a more accurate dataset year. This emission factor takes into account the baseline year's mix of energy sources used to generate electricity for a specific utility and the relative carbon intensities of these sources. The emission factor will be determined as a CO_2e incorporating the CO_2, CH_4, and N_2O emissions.

Power Utility	Carbon-Intensity (lbs CO_2e/MWh)
LADW&P	1,238
PG&E	456
SCE	641
SDGE	781
SMUD	555

5 Short-Term Emissions

Short-term or one-time emissions from the development of a Project are associated with vegetation removal and re-vegetation on the Project site and construction-related activities.

5.1 Construction Activities

Construction activities occur during the early stage of a project. Construction activities include any demolition, site grading, building construction, and paving. These construction activities have several main sources of GHG emissions. Off-road construction equipment such as dozers, pavers, and backhoes are used on-site during construction. These pieces of equipment typically are diesel fueled although other fuels are occasionally used. Besides the off-road construction, there are on-road vehicles. These vehicles are used for worker commuting, delivering of material to the site, and hauling material away from the site. The methodology to calculate these sources of emissions is described in the next sections.

5.1.1 Estimating GHG Emissions from Off-Road Construction Equipment

This section describes how emissions from off-road equipment used during demolition, site grading, building construction and paving are calculated. This section can be used for any fuel

[5] California Climate Action Registry (CCAR) Database. PUP Report.

burning equipment such as diesel, gasoline, or compressed natural gas (CNG). For electric equipment please see the method in the next section.

First, the number and type of equipment that will be used in the construction, as well as the duration of the entire construction project, is needed. Absent other data, ENVIRON recommends that each piece of equipment will operate for 8 hours a day, five days a week throughout the construction duration. An equipment hour is defined as one hour of a piece of equipment being used. Specifications for each type of construction equipment (horsepower, load factor, and GHG emission factor) are provided by OFFROAD2007[6]. CO_2 and CH_4 emissions for each type of construction equipment are calculated as follows:

$$\text{Equipment Emissions [grams]} = \text{Total equipment hours} \times \text{emission factor [grams per brake horsepower-hour]} \times \text{equipment horsepower} \times \text{load factor}^{7}$$

The grams of CO_2 and CH_4 are multiplied by their respective GWP and then the two emissions are summed to derive the final CO_2e emissions from the piece of off-road equipment. Since OFFROAD2007 does not provide an emission factor for N_2O which is a minor subset of nitrogen oxides (NO_x) emissions and the contribution to the overall GHG emissions is likely small, it is therefore not included in calculations that used OFFROAD2007. These were accounted for with alternative fuels since they have a larger proportion of N_2O and CH_4.

5.1.2 Estimating GHG emissions from Electric Off-Road Construction Equipment

In order to estimate the indirect GHG emissions associated with electricity consumption of electrical powered equipment, the following inputs are required. First, the total operating hours of the electrical piece of equipment is needed. Secondly, the amount of kilowatts the equipment uses per time is needed. These two pieces are used along with the carbon intensity factor for the local utility provider as follows:

$$\text{Equipment Emissions} = \text{Total equipment hours} \times \text{average power draw (kW/hr)} \times \text{Utility EF } (\text{g } CO_2e \text{ per kWhr})$$

5.1.3 GHG Emissions from On-Road Vehicles Associated with Construction

Emissions from on-road vehicles associated with construction include workers commuting to the site, vendors delivering materials, and hauling away of materials. GHGs are emitted from these vehicles in two ways: running emissions, produced by driving the vehicle, and startup emissions, produced by turning the vehicle on. Idling emissions will not be considered since

[6] OFFROAD2007 is a model developed by the Air Resources Board which contains emission factors for off-road equipment. It is available at : http://www.arb.ca.gov/msei/offroad/offroad.htm

[7] Load factor is the percentage of the maximum horsepower rating at which the equipment normally operates.

regulations exist which limit idling[8] and they would represent a small contribution to the GHG emissions. The majority of these on-road vehicle emissions are running emissions.

Running emissions are calculated using the same method for all trip types. The total Vehicle Miles Traveled (VMT) for the trip type category is estimated, and then multiplied by the representative GHG emission factors for the vehicles expected to be driven. The total VMT for a given trip type is calculated as follows:

$$VMT \quad = \quad Number\ of\ round\ trips \quad x \quad average\ round\ trip\ length\ (miles)$$

The number of trips should be based on project specific information. Default values associated with each land use type can be obtained construction cost estimators or default values in emission estimator programs. Average round trip length should be based on project specific information or county specific default values. After total VMT is calculated, GHG emissions for on-road vehicles associated with construction can be calculated from the following equation:

$$CO_2\ emissions \quad = \quad VMT \quad x \quad EF_{running}$$

Where:

VMT = vehicle miles traveled
$EF_{running}$ = running emission factor for vehicle fleet for trip type

The CO_2 calculation involves the following assumptions:

a. Vehicle Fleet Defaults:

    a. Workers commute half with light duty trucks (LDTs) and half commute in light duty autos (LDAs). Half of the LDTs are type 1 and the other half type 2.

    b. Vendors are all heavy-heavy duty vehicles.

    c. Hauling is all heavy-heavy duty vehicles.

b. The emission factor depends upon the speed of the vehicle. A default value of 35 miles per hour will be used.

c. EMFAC emission factors from the construction year will be used for $EF_{running}$.

[8] The Air Resources Board adopted in 2004 and modified in 2005 an Air Toxic Control Measure that limits idling in diesel vehicles to 5-minutes. http://www.arb.ca.gov/msprog/truck-idling/truck-idling.htm

The emissions associated with CH_4 and N_2O are calculated in a similar manner or assumed to represent 5% of the total CO_2e emissions. They are then converted to CO_2e by multiplying by their respective global warming potential.

Startup emissions are CO_2 emitted from starting a vehicle. For the various trips during all phases, the startup emissions are calculated using the following assumptions:

a. The same vehicle fleet assumptions as used in running emissions.

b. Two engine startups per day with a 12 hour wait before each startup.[9]

The USEPA recommends assuming that CH_4, N_2O, and HFCs account for 5% of GHG emissions from on-road vehicles, taking into account their GWPs.[10] To incorporate these additional GHGs into the calculations, the total GHG footprint is calculated by dividing the CO_2 emissions by 0.95.

5.2 Vegetation Change

ENVIRON suggests following the IPCC protocol for vegetation since it has default values that work well with the information typically available for development projects. This method is similar to the CCAR Forest Protocol[11] and the Center for Urban Forest Research Tree Carbon Calculator[12], but it has more general default values available that will generally applicable to all areas of California without requiring detailed site-specific information[13].

5.2.1 Quantifying the One-Time Release by Changes in Carbon Sequestration Capacity

The one-time release of GHGs due to permanent changes in carbon sequestration capacity is calculated using the following four steps:[14]

1. *Identify and quantify the change in area of various land types due to the development (i.e. alluvial scrub, non-native grassland, agricultural, etc.).* These area changes include not only the area of land that will be converted to buildings, but also areas disrupted by the construction of utility corridors, water tank sites, and associated borrow and grading areas.

---

[9] The emission factor grows with the length of time the engine is off before each ignition.

[10] USEPA. 2005. *Emission Facts: Greenhouse Gas Emissions from a Typical Passenger Vehicle.* Office of Transportation and Air Quality. February.

[11] CCAR. 2007. Forest Sector Protocol Version 2.1. September. Available at: http://www.climateregistry.org/resources/docs/protocols/industry/forest/forest_sector_protocol_version_2.1_sept2007.pdf

[12] Available at: http://www.fs.fed.us/ccrc/topics/urban-forests/ctcc/

[13] The CCAR Forest Protocol and Urban Forest Research Tree Carbon Calculator are not used since their main focus is annual emissions for carbon offset considerations. As such they are designed to work with very specific details of the vegetation that is not available at a CEQA level of analysis.

[14] This section follows the IPCC guidelines, but has been adapted for ease of use for these types of Projects.

Areas temporarily disturbed that will eventually recover to become vegetated will not be counted as vegetation removed as there is no net change in vegetation or land use.[15]

2. *Estimate the biomass associated with each land type.* For the purposes of this report, ENVIRON suggests using the available general vegetation types found in the IPCC publication Guidelines for National Greenhouse Gas Inventories (IPCC Guidelines).[16]

   California vegetation is heavily dominated by scrub and chaparral vegetation which may not be accurately characterized by default forest land properties. Consequently, ecological zones and biomass based subdivisions identified in the IPCC Guidelines were used to sub-categorize the vegetation as scrub dominated. These subcategories should be used to determine the CO_2 emissions resulting from land use impacts.

3. *Calculate CO_2 emissions from the net change of vegetation.* When vegetation is removed, it may undergo biodegradation,[17] or it may be combusted. Either pathway results in the carbon (C) present in the plants being combined with oxygen (O_2) to form CO_2. To estimate the mass of carbon present in the biomass, biomass weight is multiplied by the mass carbon fraction, 0.5.[18] The mass of carbon is multiplied by 3.67[19] to calculate the final mass of CO_2, assuming all of this carbon is converted into CO_2.

4. Calculate the overall change in sequestered CO_2. – For all types of land that change from one type of land to another,[20] initial and final values of sequestered CO_2 are calculated using the equation below.

   Overall Change in Sequestered CO_2 [MT CO_2]

$$= \sum_i (SeqCO_2)_i \times (area)_i - \sum_j (SeqCO_2)_j \times (area)_j$$

   Where:

$SeqCO_2$	=	mass of sequestered CO_2 per unit area [MT CO_2/acre]
area	=	area of land for specific land use type [acre]
i	=	index for final land use type
j	=	index for initial land use type

---

[15] This assumption facilitates the calculation as a yearly growth rate and CO_2 removal rate does not have to be calculated. As long as the disturbed land will indeed return to its original state, this assumption is valid for time periods over 20 years.

[16] Available online at http://www.ipcc-nggip.iges.or.jp/public/2006gl/vol4.htm

[17] Cleared vegetation may also be deposited in a landfill or compost area, where some anaerobic degradation which will generate CH_4 may take place. However, for the purposes of this section, we are assuming that only aerobic biodegradation will take place which will result in CO_2 emissions only.

[18] The fraction of the biomass weight that is carbon. Here, a carbon fraction of 0.5 is used for all vegetation types from CCAR Forest Sector Protocol.

[19] The ratio of the molecular mass of CO_2 to the molecular mass of carbon is 44/12 or 3.67.

[20] For example from forestland to grassland, or from cropland to permanently developed.

5.2.2 Calculating CO_2 Sequestration by Trees

Planting individual trees will sequester CO_2. Changing vegetation as described above results in a one-time carbon-stock change. Planting trees is also considered to result in a one-time carbon-stock change. Default annual CO_2 sequestration rates on a per tree basis, based on values provided by the IPCC are used[21]. An average of 0.035 MT CO_2 per year per tree can be used for trees planted, if the tree type is not known.

Urban trees are only net carbon sinks when they are actively growing. The IPCC assumes an active growing period of 20 years. Thereafter, the accumulation of carbon in biomass slows with age, and will be completely offset by losses from clipping, pruning, and occasional death. Actual active growing periods are subject to, among other things, species, climate regime, and planting density. In this report, the IPCC default value of 20 years is recommended. For large tree sequestration projects, the Project may consider using the Forest or Urban tree planting protocols developed by Climate Action Registry (CAR). These protocols have slightly different assumptions regarding steady state, tree growth, and replacement of trees..

5.3 Built Environment

The amount of energy used, and the associated GHG emissions emitted per square foot of available space vary with the type of building. For example, food stores are far more energy intensive than warehouses, which have little climate-conditioned space. Therefore, this analysis is specific to the type of building.

GHGs are emitted as a result of activities in buildings for which electricity and natural gas are used as energy sources. Combustion of any type of fuel emits CO_2 and other GHGs directly into the atmosphere; when this occurs within a building (such as by natural gas consumption) this is a direct emission source[22] associated with that building. GHGs are also emitted during the generation of electricity from fossil fuels. When electricity is used in a building, the electricity generation typically takes place offsite at the power plant; electricity use in a building generally causes emissions in an indirect manner.

Energy use in buildings is divided into energy consumed by the built environment and energy consumed by uses that are independent of the construction of the building such as plug-in appliances. In California, Title 24 part 6 governs energy consumed by the built environment, mechanical systems, and some fixed lighting. This includes the space heating, space cooling, water heating, and ventilation systems. Non-building energy use, or "plug-in" energy use can be further subdivided by specific end-use (refrigeration, cooking, office equipment, etc.). The following two steps are performed to quantify the energy use due to buildings:

---

[21] The Center for Urban Forest Research Tree Carbon Calculator is not suggested since it requires knowledge on specific tree species to estimate carbon sequestered. This information is typically not available during the preparation of CEQA documents.

[22] California Climate Action Registry (CCAR) General Reporting Protocol (GRP), Version 3.1 (January). Available at: http://www.climateregistry.org/resources/docs/protocols/grp/GRP_3.1_January2009.pdf, Chapter 8

1. Calculate energy use from systems covered by Title 24[23] (HVAC system, water heating system, and the lighting system).
2. Calculate energy use from office equipment, plug-in lighting, and other sources not covered by Title 24.

The resulting energy use quantities are then converted to GHG emissions by multiplying by the appropriate emission factors obtained by incorporating information on local electricity providers for electricity, and by natural gas emission factors for natural gas combustion.

ENVIRON recommends using default values for Title 24 and non-Title 24 energy use for various building types. These will take into account the building size and climate zone. There are several sources of information that can be used to obtain building energy intensity. Each is described briefly below.

The *California Commercial Energy Use Survey* (CEUS) data is provided by the California Energy Commission (CEC). It is based on a survey conducted in 2002 for existing commercial buildings in various climate zones. Electricity and natural gas use per square foot for each end use in each building type and climate zone is extracted from the CEUS data. Since the data is provided by end use, it is straightforward to calculate the Title 24 and non-Title 24 regulated energy intensity for each building type.

Commercial Buildings Energy Consumption Survey (CBECS) is a survey of non-residential buildings that was conducted in 2003 by the Energy Information Administration (EIA). Electricity and natural gas use per square foot can be extracted from this data. The energy use estimates are assumed to represent 2001 Title 24 compliant buildings. Using CBECS, the percent of electricity and natural gas used for each end use can be calculated. It is then straightforward to calculate the Title 24 and non-Title 24 electricity and natural gas intensity for each building type. Similar surveys exist for manufacturing and residential energy use.

The *Residential Appliance Saturation Survey* (RASS) refers to the California Energy Commission Consultant Report entitled "California Statewide Residential Appliance Saturday Study". Data from RASS is used to calculate the total electricity and natural gas use for residential buildings on a per dwelling unit. The RASS study estimates the unit energy consumption (UEC) values for individual households surveyed and also provides the saturation number for each type of end use. The saturation number indicates the proportion of households that have a demand for each type of end-use category. As the data is provided by end use, it is straightforward to calculate the Title 24 and non-Title 24 electricity and natural gas intensity for each building type.

Alternative Calculation Method (ACM) software is available that makes estimates of the energy consumption by a model Title 24 compliant building. These programs provide

[23] Title 24, Part 6, of the California Code of Regulations: California's Energy Efficiency Standards for Residential and Nonresidential Buildings. http://www.energy.ca.gov/title24/

annual energy use for the heating, ventilation, and air conditioning (HVAC) system in each building; therefore, estimates from ACM software represent Title 24-regulated energy use. These do not calculate the non-Title 24 energy use for the buildings.

The Department of Energy produced the *Building America Research Benchmark Definition* (BARBD) technical manual, which presents empirical equations for electricity and natural gas usage. As the data is provided by end use, it is straightforward to calculate the Title 24 and non-Title 24 electricity and natural gas intensity for each building type.

Literature surveys may also be used for building and land use types not well represented by the above sources.

ENVIRON suggests using the CEUS and RASS datasets for these calculations since the data is available for several land use categories in different climate zones in California.

The Title 24 standards have been updated twice (in 2005 and 2008) since some of these data were compiled. CEC has published reports estimating the percentage deductions in energy use resulting from these new standards. Based on CEC's discussion on average savings for Title 24 improvements, these CEC savings percentages by end use can be used to account for reductions in electricity use due to updates to Title 24. Since energy use for each different system type (ie, heating, cooling, water heating, and ventilation) as well as appliances is defined, this method will easily allow for application of mitigation measures aimed at reducing the energy use of these devices in a prescriptive manner.

Based on the electricity intensity, CO_2e intensity values (CO_2e emissions per square foot or dwelling unit, as applicable, per year) for each building type can be calculated. Electricity intensity data is multiplied by an electricity emission factor to generate CO_2e intensity values. The total CO_2e emissions from each building type are calculated by multiplying the CO_2e intensity values by the appropriate metric (building square footage for non-residential buildings or number of dwelling units for residential buildings). Summing the CO_2e emissions from all building types gives the total CO_2e emissions from electricity use in Title 24 and non-Title 24 sources in buildings.

Based on the natural gas intensity, CO_2e intensity values (CO_2e emissions per square foot or dwelling unit, as applicable, per year) for each building type can be calculated. Natural gas intensity data is multiplied by a natural gas emission factor to generate CO_2e intensity values. The total CO_2e emissions from each building type are calculated by multiplying the CO_2 intensity values by the appropriate metric (building square footage for non-residential buildings or number of dwelling units for residential buildings). Summing the CO_2e emissions from all building types gives the total CO_2e emissions from natural gas use in Title 24 and non-Title 24 sources in buildings.

5.3.1 Natural Gas Boilers

GHG emissions from the combustion of natural gas are calculated as the product of natural gas consumption, natural gas heat content, and carbon-intensity factor. The Project Applicant has to determine the natural gas consumption, while the heat content and carbon-intensity factor can obtained from the CCAR General Reporting Protocol.

5.4 Area Sources

Area sources are local combustion of fuel. The area sources covered in this section include natural gas fireplaces/stoves and landscape maintenance equipment. Natural gas usage from the primary building heating is not included in this category since it is already included with building energy use. Each of these area sources is discussed further.

5.4.1 Natural Gas Fireplaces/Stoves

GHG emissions associated with natural gas fired fireplaces are calculated using emission factors from CCAR. The average BTU per hour for fireplaces in homes needs to be specified. Default values for annual fireplace usage varies for each County. Natural gas is assumed to have 1,020 BTU per standard cubic foot[24].

5.4.2 Landscape Maintenance

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, roto tillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers, as well as air compressors, generators, and pumps.

Similar to construction off-road equipment, emission factors are based on the OFFROAD2007 model. These are combined with the hours of operation for each equipment piece as well as the horsepower and load factors. The GHG emissions will be calculated based on the emission factors for the equipment and fuel reported from OFFROAD2007 and the appropriate GWP. Default usages (hours of operation) should be determined for the landscape equipment based on the Project needs.

5.5 Water

Delivering and treating water for use at the project site requires energy. This embodied energy associated with the distribution of water to the end user is associated with the electricity to pump and treat the water. GHG emissions due to water use are related to the energy used to convey, treat and distribute water. Thus, these emissions are indirect emissions from the production of electricity to power these systems.

The amount of electricity required to treat and supply water depends on the volume of water involved. Three processes are necessary to supply water to users: (1) supply and conveyance of the water from the source; (2) treatment of the water to potable standards; and (3) distribution of the water to individual users.

---

[24] USEPA. 1998. AP-42 Emission Factors. Chapter 1.4 Natural Gas Combustion.

Therefore, to quantify the GHG emissions associated with the distribution of water to an end user, the carbon intensity of electricity is used along with the amount of electricity used in pumping and treating the water. Since consumption of water varies greatly for each land use type, default values need to be determined with several listed in the mitigation measure fact sheets. Since buildings may have different percentages of water associated with indoor and outdoor water usage, the water usage is quantified separately. In addition since mitigation measures associated with water use may be directed separately toward indoor and outdoor water usage, this will be beneficial for this task.

5.5.1 Indoor

Indirect emissions resulting from electricity use are determined by multiplying electricity use by the CO_2e emission factor provided by the local electricity supplier. Energy use per unit of water for different aspects of water treatment (e.g. source water pumping and conveyance, water treatment, distribution to users) is determined using the stated volumes of water and energy intensities values (i.e., energy use per unit volume of water) provided by reports from the California Energy Commission (CEC) on energy use for California's water systems.[25] The CEC report estimates the electricity required to extract and convey one million gallons of water. Using this energy intensity factor, the expected indoor water demand, and the utility-specific carbon-intensity factor, GHG emissions from indoor water supply and conveyance may be calculated.

The amount of electricity required to treat and distribute one million gallon of potable water is estimated in the CEC report. Based on the estimated indoor water demand, these energy intensity factors, and the utility-specific carbon intensity factor, GHG emissions from indoor water treatment and distribution may be calculated.

The sum of emissions due to supplying, conveying, treating, and distributing indoor water gives the total emissions due to indoor water use.

5.5.2 Outdoor

Indirect emissions resulting from electricity use are determined by multiplying electricity use by the CO_2 emission factor provided by the local electricity supplier. Energy use per unit of water for different aspects of water treatment (e.g. source water pumping and conveyance, water treatment, distribution to users) is determined using the stated volumes of water and energy intensities values (i.e., energy use per unit volume of water) provided by reports from the California Energy Commission (CEC) on energy use for California's water systems.[26] The

CEC 2006. Refining Estimates of Water-Related Energy Use in California. PIER Final Project Report. Prepared by Navigant Consulting, Inc. CEC-500-2006-118. December.

[26] CEC 2005. California's Water-Energy Relationship. Final Staff Report. CEC-700-2005-011-SF,

CEC 2006. Refining Estimates of Water-Related Energy Use in California. PIER Final Project Report. Prepared by Navigant Consulting, Inc. CEC-500-2006-118. December.

energy needed to supply and convey the water will be used to pump this water from the sources and distribute it throughout the development. The CEC report estimates the electricity required to extract and convey one million gallons of water. Using this energy intensity factor, the expected outdoor water demand, and the utility-specific carbon-intensity factor, GHG emissions from outdoor water supply and conveyance may be calculated.

The amount of electricity required to treat and distribute one million gallon of potable water (see recycled water for non-potable water) is estimated in the CEC report. Based on the estimated outdoor water demand, these energy intensity factors, and the utility-specific carbon intensity factor, GHG emissions from outdoor water treatment and distribution may be calculated.

The sum of emissions due to supplying, conveying, treating, and distributing outdoor water gives the total emissions due to outdoor water use.

5.5.2.1 Landscape Watering – Turf Grass

The amount of outdoor water used in the landscape watering of turf grass is calculated based on the California Department of Water Resources (CDWR) 2009 Model Water Efficient Landscape Ordinance[27] and the CDWR 2000 report "A Guide to Estimating Irrigation Water Needs of Landscape Plantings in California: The Landscape Coefficient Method and WUCOLS III."[28] Using this methodology, the amount of water required to support the baseline turf water demand ($Water_{baseline}$) is calculated as follows:

$$ETC = Kc \times ET_0$$

Where:

ETC	=	Crop Evapotranspiration, the total amount of water the baseline turf loses during a specific time period due to evapotranspiration[29] (inches water/day)
KC	=	Crop Coefficient, factor determined from field research, which compares the amount of water lost by the crop (e.g. turf) to the amount of water lost by a reference crop (unitless). Species-specific; provided in CDWR 2000
ET_0	=	Reference Evapotransporation, the amount of water lost by a reference crop (inches water/day) Region-specific; provided in Appendix A of CDWR 2009

[27] California Department of Water Resources. 2009. Model Water Efficient Landscape Ordinance. Available online at: http://www.water.ca.gov/wateruseefficiency/docs/MWELO09-10-09.pdf

[28] California Department of Water Resources. 2000. A Guide to Estimating Irrigation Water Needs of Landscape Plantings in California: The Landscape Coefficient Method and WUCOLS III. Available online at: http://www.water.ca.gov/pubs/conservation/a_guide_to_estimating_irrigation_water_needs_of_landscape_plantings_in_california__wucols/wucols00.pdf

[29] Evapotranspiration is water lost to the atmosphere due to evaporation from soil and transpiration from plant leaves. For a more detailed definition, see this California Irrigation Management Information System (CIMIS) website: http://wwwcimis.water.ca.gov/cimis/infoEtoOverview.jsp;jsessionid=91682943559928B8A9A243D2A2665E19

Then:

$$\text{Water}_{\text{baseline}} = \text{ETC x Areabaseline X 0.62 x 365}$$

Where:

$\text{Water}_{\text{baseline}}$	=	Volume of water required to support the baseline turf (gallons/year)
$\text{Area}_{\text{baseline}}$	=	Area of existing or standard turf (square feet)
0.62	=	conversion factor (gallons/squarefoot.inches water)
365	=	conversion factor (days/year)

Based on the estimated outdoor water demand for watering turf grass, the outdoor water energy intensity factors described above, and the utility-specific carbon intensity factor, GHG emissions from watering turf grass in lawns may be calculated.

5.5.2.2 Landscape Watering – General

The amount of outdoor water used in the landscape watering of landscapes and lawns is calculated based on the California Department of Water Resources (CDWR) 2009 Model Water Efficient Landscape Ordinance.[30] Using this methodology, the amount of water required to support the baseline lawn water demand ($\text{Water}_{\text{baseline}}$) is defined as the Maximum Applied Water Allowance (MAWA) and is calculated as follows:

$$\text{Water}_{\text{baseline}} = \text{MAWA} = \text{ET}_0 \text{ x } 0.62 \text{ x } [(0.7 \text{ x LA}) + (0.3 \text{ x SLA})]$$

Where:

$\text{Water}_{\text{baseline}}$	=	Volume of water required to support the baseline lawn (gallons/year)
MAWA	=	Maximum Applied Water Allowance (gallons/year)
ET_0	=	Annual Reference Evapotranspiration[31] from Appendix A of CDWR 2009 (inches per year)
0.7	=	ET Adjustment Factor (ETAF)
LA	=	Landscape Area[32] includes Special Landscape Area[33] (square feet)

[30] California Department of Water Resources. 2009. Model Water Efficient Landscape Ordinance. Available online at: http://www.water.ca.gov/wateruseefficiency/docs/MWELO09-10-09.pdf

[31] Evapotranspiration is water lost to the atmosphere due to evaporation from soil and transpiration from plant leaves. For a more detailed definition, see this California Irrigation Management Information System (CIMIS) website: http://wwwcimis.water.ca.gov/cimis/infoEtoOverview.jsp;jsessionid=91682943559928B8A9A243D2A2665E19

[32] § 491 Definitions in CDWR 2009: "Landscape Area (LA) means all the planting areas, turf areas, and water features in a landscape design plan subject to the Maximum Applied Water Allowance calculation. The landscape area does not include footprints of buildings or structures, sidewalks, driveways, parking lots, decks, patios, gravel or stone walks, other pervious or non-pervious hardscapes, and other non-irrigated areas designed fro non-development (e.g., open spaces and existing native vegetation)."

[33] § 491 Definitions in CDWR 2009: "Special Landscape Area (SLA) means an area of the landscape dedicated

0.62	=	Conversion factor (to gallons per square foot)
SLA	=	Portion of the landscape area identified as Special Landscape Area (square feet)
0.3	=	the additional ETAF for Special Landscape Area

Based on the estimated outdoor water demand for watering lawns, the outdoor water energy intensity factors described above, and the utility-specific carbon intensity factor, GHG emissions from watering lawns may be calculated.

5.5.3 Recycled Water

After use, wastewater is treated and reused as reclaimed water. Any reclaimed water produced is generally redistributed to users via pumping. An estimate of the non-potable water demand to be met through the distribution of recycled water is needed. Estimates of the amount of energy needed to redistribute and, if necessary, treat reclaimed water is 400 kW-hr per acre foot.[34] Based on the estimated demand for reclaimed water, the estimated electricity demand and the utility-specific carbon-intensity factor, non-potable reclaimed water redistribution emissions are calculated.

5.5.4 Process

Industrial land uses can use a large amount of water for their processes. The water used for this will not be quantified since there is not sufficient water use data for this type of land use for the development of a default value. Water use is highly dependent on the specific industry..

5.6 Wastewater

Emissions associated with wastewater treatment include indirect emissions necessary to power the treatment process and direct emissions from degradation of organic material in the wastewater.

5.6.1 Direct Emissions

Direct emissions from wastewater treatment include emissions of CH_4 and biogenic CO_2. The method described by the Local Government Operations Protocol developed by the California Air Resources Board is suggested with default values assigned since detailed plant specific data will typically not be available.[35] The assumed daily 5-day carbonaceous biological oxygen

---

solely to edible plants, areas irrigated with recycled water, water features using recycled water and areas dedicated to active play such as parks, sports fields, golf courses, and where turf provides a playing surface."

[35] California Air Resources Board. 2008. *Local Government Operations Protocol - for the quantification and reporting of greenhouse gas emissions inventories*. Version 1.0. September 2008. Developed in partnership by California Air Resources Board, California Climate Action Registry, ICLEI - Local Governments for Sustainability, The Climate Registry

demand (BOD_5) of 200 mg/L-wastewater is multiplied by the protocol defaults for maximum CH_4-producing capacity (0.6 kg-CH_4/kg-BOD_5) and other default values to obtain the direct CH_4 emission. The amount of digester gas produced per volume of wastewater, and amount of N_2O per volume of wastewater needs to be determined. These values are then multiplied by the Global Warming Potential factor[36] of 21 for CH_4 or 310 for the GWP of N_2O that would be generated otherwise to obtain the annual CO_2 equivalent emissions.

5.6.2 Indirect Emissions

Indirect GHG emissions result from the electricity necessary to power the wastewater treatment process. The electricity required to operate a wastewater treatment plant is estimated to be 1,911 kW-hr per million gallons.[37] Based on the expected amount of wastewater requiring treatment, which will be assumed to be equal to the indoor potable water demand absent other data, the energy intensity factor and the utility-specific carbon-intensity factor, indirect emissions due to wastewater treatment are calculated.

5.7 Public Lighting

Lighting sources contribute to GHG emissions indirectly, via the production of the electricity that powers these lights. Lighting sources considered in this source category include streetlights, traffic lights, and parking lot lights. The annual electricity use may be estimated using the number of heads, the power requirements of each head, and the assumption that they operate for 12 hours a day on average for 365 days per year or 24 hours for traffic lights. The emission factor for public lighting is the utility-specific carbon-intensity factor. Multiplying the electricity usage by the emission factor gives an estimate of annual CO_2e emissions from public lighting.

5.8 Municipal Vehicles

GHG emissions from municipal vehicles are due to direct emissions from the burning of fossil fuels. Municipal vehicles considered in this source category include vehicles such as police cars, fire trucks, and garbage trucks. Data from reports by Medford, MA; Duluth, MN; Northampton, MA; and Santa Rosa, California[38] show that the CO_2 emissions from municipal

October.http://www.ci.duluth.mn.us/city/information/ccp/GHGEmissions.pdf vehicles would be approximately[39] 0.05 MT per capita per year. Using these studies and the expected population, emissions from municipal vehicles may be calculated.

5.9 On-Road Mobile Sources

This section estimates GHG emissions from on-road mobile sources. The on-road mobile source emissions considered a project will be from the typical daily operation of motor vehicles by project residents and non-residents. The GHG emissions based upon all vehicle miles traveled associated with residential and non-residential trips regardless of internal or external destinations or purpose of trip are estimated. Traffic patterns, trip rates, and trip lengths are based upon the methods discussed below.

The CCAR GRP[40] recommends estimating GHG emissions from mobile sources at an individual vehicle level, assuming knowledge of the fuel consumption rate for each vehicle as well as the miles traveled per car. Since these parameters are not known for a future development, the CCAR guidance can not be used as recommended.

Estimating Trip Rates

The majority of transportation impact analysis conducted for CEQA documents in California apply trip generation rates provided by the Institute of Transportation Engineers (ITE) in their regularly updated report *Trip Generation*. The report is based on traffic counts data collected over four decades at built developments throughout the United States. This data is typically based on single-use developments, in suburban locations with ample free parking and with minimal transit service and demand management strategies in place. As a result, the ITE trip generation rates represent upper bound trip generation rates for an individual land use type. This represents a good basis against which to measure the trip-reducing effects of any one or more of the mitigation strategies that will be quantified in subsequent tasks. Therefore, we recommend ITE trip rates as the baseline condition against which the effectiveness of CAPCOA's mitigation measures is applied.

There are some CEQA traffic studies that use data other than ITE trip generation rates. Below we briefly discuss the possible use of these alternative datasets. These traffic studies typically use trip generation data from one of the following sources:

SANDAG Traffic Generators. In the San Diego region, most studies use data from the SANDAG *Traffic Generators* report. This report is similar to the ITE *Trip Generation* in that it uses primarily suburban, single use developments, except that this dataset is based on traffic counts conducted in the San Diego region rather than throughout the United States. In studies where the SANDAG data is used, CAPCOA reviewers should apply the trip reduction estimates presented in subsequent tasks directly to the SANDAG trip generation rates.

---

[39] In an effort to be conservative, the largest per capita number from these four reports was used.

[40] California Climate Action Registry (CCAR). 2009. *General Reporting Protocol*. Version 3.1. January.

Travel Forecast Models. For some large development projects or general plans, the local or regional travel model is used to estimate the number of trips generated as well as trip lengths and vehicle speeds at which the individual trips occur. These models account for whether the trip segment occurs on a freeway or local streets as well as the degree of congestion. The values for trip generation rates and trip lengths using ITE and average trip lengths can be to assess the model estimates of vehicle trip generation and VMT. These comparisons should recognize that the travel models explicitly account for various factors that reduce trip-making and VMT, including the demographic characteristics of the site occupants, location and accessibility of the development site relative to other destinations in the region, the mix of land uses within the site and its surrounding area, and possibly the availability of effective transit service. When performing a comparison using the ITE trip rates and average trip lengths, the reviewer should take into consideration that these factors have already been accounted for in the modeling. Therefore, we recommend applying ITE trip rates and lengths along with the adjustments recommended elsewhere in this document (accounting for site location, design and demographics) as a means of reality-checking transportation model results.

Traffic counts at comparable developments. Some traffic assessments elect to conduct traffic counts at existing developments that are similar to the proposed development. When reviewing impact assessments produced using such information, the reviewer should take into account the extent to which the surveyed development(s) already contain trip generation and trip length reducing measures. Care needs to be used to avoid double-counting reductions.

Estimating VMT from Mobile Sources

Data on average trip lengths are used to translate trip generation rates into vehicle miles of travel (VMT). These trip lengths should be obtained from published sources of average trip lengths for different types of trip types (i.e., commute trips, shopping trips, and others) for each region within the state. Vehicle miles traveled (VMT) are calculated by multiplying ITE trip rates by the typical trip lengths.

Some mechanisms that reduce trip generation rates and trip lengths below these standard ITE-trip rates and current average trip lengths might be considered to be intrinsic parts of the development proposal rather than mitigation measures, such as project location (e.g., infill or transit oriented development [TOD]), density, mix of uses, and urban design. These are not considered part of the baseline condition, but are recognized and quantified as project design features (PDFs). This approach has the following advantages: 1) it creates a consistent basis of analysis for all development projects regardless of location and self-mitigating features already included in the project proposal, and 2) it highlights all elements of a project that reduce trip generation rates and vehicle miles traveled.

Other Factors Influencing Mobile Source GHG Emissions

Beyond trip generation, trip length and VMT, other factors that affect GHG emissions include traffic flow, vehicle fuel consumption rates, and fuel type.

Traffic speed and efficiency profiles are largely influenced by: a) the project location and degree of prevailing congestion in its vicinity, b) the degree to which the project implements traffic level-of-service mitigation measures often triggered by CEQA review, and c) actions taken by local, regional governments and Caltrans to reduce corridor or area-wide congestion.

The simplified mitigation assessment methods developed for this study use several categories of emissions factors per VMT that account for a) the generalized project location (core infill, inner ring suburbs, outer suburbs, rural), and b) and region-specific fleet and emissions rate if available.

While it is beyond the scope of this document to provide CAPCOA the ability to perform traffic speed and efficiency analysis, the study report advises CAPCOA on the type of analysis to expect to see in CEQA documents on development projects. CEQA impact and mitigation assessment methods should continue to perform air quality analysis using tools such as EMFAC that reference prevailing traffic speed profiles, especially for infill development and congested corridors, while applying appropriate credit for congestion reducing measures included in the project mitigation requirements, funded capital improvements plans, and fiscally constrained Regional Transportation Plans (RTPs.)

5.9.1 Estimating GHG Emissions from Mobile Sources

The CO_2 emissions from mobile sources were calculated with the trip rates, trip lengths and emission factors for running and starting emissions from EMFAC2007 as follows:

$$CO_2\ emissions \quad = \quad VMT \quad x \quad EF_{running}$$

Where:

VMT = vehicle miles traveled
$EF_{running}$ = emission factor for running emissions

The CO_2e calculation involves the following assumptions:

- The emission factor depends upon the speed of the vehicle.
- EMFAC emission factors from the baseline year will be used for $EF_{running}$ based on County specific fleet mix for different trip types and adjusted to account for applicable regulations that are not currently incorporated yet into EMFAC.

Startup emissions are CO_2 emitted from starting a vehicle. Startup emissions are calculated using the following assumptions:

- The number of starts is equal to the number of trips made annually.
- The breakdown in vehicles is EMFAC fleet mix for County specific fleet mix.
- The emission factor for startup is calculated based on a weighted average of time between starts for each trip type (commute trips versus all other types).

Fleet distribution types will be based on EMFAC2007 or the most recent EMFAC version available. For mobile sources, the USEPA recommends assuming that CH_4, N_2O, and HFCs account for 5% of GHG emissions from on-road vehicles, taking into account their GWPs.[41] To incorporate these additional GHGs into the calculations, the total GHG footprint is calculated by dividing the CO_2 emissions by 0.95.

Emission factors for alternative fuel can be obtained from the CCAR General Reporting Protocol. For comparison with alternative fuel, N_2O and CH_4 emissions should be calculated separately as their emissions from alternative fuel are generally higher than from gasoline or diesel.

Low-emission-vehicle programs, such as neighborhood electric vehicles (NEV) or car sharing programs, will only be considered in accounting for GHG reductions if included in project-specific design or mitigation measures.

5.10 GHG Emissions from Specialized Land Uses

Below are methods to quantify GHG emissions from some additional land use categories that may be commonly found in development projects. These include golf courses and swimming pools. The methods proposed to determine GHG emissions associated with these sources is discussed in the following sections. The GHG emissions will typically fall into other categories such as landscape maintenance, water usage, and buildings, but since the data sources are different, they are explicitly described.

5.10.1 Golf Courses

Emission flux resulting from the construction of the golf course is not discussed, nor is the sequestration of CO_2 into the turf, trees, or lakes of the golf course. Operational CO_2 emissions were calculated for three areas: irrigation, maintenance (mowing), and on-site buildings' energy use. All three components are discussed in this section.

5.10.2 Calculating CO_2 Emissions from Irrigation of the Golf Course

The release of GHGs due to irrigation practices was calculated in two steps:

1. Identify the quantity of water needed.

2. Calculate the emissions associated with pumping the water.

1. *Identify the quantity of water needed.* Standard water use for an 18-hole golf course ranges from 250 to 450 acre-ft yearly. A survey of golf course superintendents conducted in the summer of 2003 by the Northern and Southern California Golf Associations revealed an annual average California usage of 345 acre-ft.[42] Numerous factors will affect the actual water usage

---

[41] USEPA. 2005. *Emission Facts: Greenhouse Gas Emissions from a Typical Passenger Vehicle.* Office of Transportation and Air Quality. February.

[42] Northern California Golf Association. Improving California Golf Course Water Efficiency, pg 14. http://www.owue.water.ca.gov/docs/2004Apps/2004-079.pdf

of a specific golf course, and it is likely to vary by year. ENVIRON recommends using the average usage of 345 acre-ft per year annually.

2. Calculate the associated emissions. Using the information identified above, ENVIRON calculates total emissions from irrigation of an 18-hole golf course as follows:

Estimate total dynamic head: This is the combination of lift (300 feet) and desired pressure. Standard athletic field sprinklers require a base pressure of approximately 65 psi.[43]

$$\begin{array}{lcl} 60\ psi\ \ x\ \ 2.31\ ft/psi^{44} & = & 139\ ft \\ \underline{+\ \ lift} & \underline{=} & \underline{300\ ft} \\ Total\ dynamic\ head & = & 439\ ft \end{array}$$

Identify fuel unit and multiply by head: Possible pumping fuels include electricity, natural gas, diesel, and propane. In these calculations, ENVIRON assumes that all pumps will use electricity. Based on the literature, ENVIRON recommends using a pumping energy use of 1.551 kW-hr/acre-ft/ft.[45]

$$1.551\ kW\text{-}hr/acre\text{-}ft/ft \quad x \quad 439\ ft \quad = \quad 681\ kW\text{-}hr/acre\text{-}foot$$

Multiply energy demand by emission factor and convert to MT: The energy demand per acre-ft calculated above is multiplied by the emission factor for the electricity generation source and converted to MT.

$$\frac{681kW\text{-}hr/acre\text{-}ft\ x\ 0.666\ lbs\ CO_2/kW\text{-}hr}{2204.62\ lbs/ton} = 0.21\ MT\ CO_2/acre\text{-}ft$$

The anticipated annual water demand will be multiplied by these values and then combined this with the calculated emission factor yields total annual emissions from irrigation of the golf course. Other outdoor land uses that require irrigation can follow a similar procedure.

5.10.3 Calculating CO_2 Emissions from Maintenance of the Golf Course

Maintenance emissions include the emissions resulting from the mowing of turf grass. The release of GHGs due to mowing was calculated in three steps:

1. Identify the area of turf and frequency of mowing.
2. Identify the efficiency of a typical mower.

---

[43] Full Coverage Irrigation. Partial List of Customers Using FCI Nozzles. http://www.fcinozzles.com/clients.asp.

[44] Conversion factor: 1 psi = 2.31 feet of head. Kele & Associates Technical Reference: Liquid Level Measurement. http://www.kele.com/tech/monitor/Pressure/LiqLevMs.pdf

[45] Kansas State University Irrigation Management Series. Comparing Irrigation Energy Costs. Table 4. http://www.oznet.ksu.edu/library/ageng2/mf2360.pdf

3. Calculate the emissions associated with mowing.

1. *Identify the area of turf and frequency of mowing*: An Arizona State economic analysis of golf courses reports that on average 2/3 of the land within a golf course is maintained.[46] ENVIRON suggests assuming that the course will be mowed twice weekly, although high maintenance areas such as greens will be mowed more frequently.[47] ENVIRON recommends a growing season of 52 weeks/year.[48]

2. *Identify the efficiency of a typical mower*. Typical mower calculations are based on the specifications for a lightweight fairway mower (model 3235C) reported by John Deere's Golf & Turf division.[49] A typical mower will use one tank (18 gallons) of diesel per day (assumed to be 8 hours). Given the size specifications of the mower and assuming an average speed of 5.5 mph, such a mower can cover 44 acres on 18 gallons of diesel.

3. *Calculate the emissions associated with mowing*. Using the information collected above and a CO_2 emission factor for diesel combustion[50], ENVIRON calculates the emission factor for mowing the golf course:

$$\frac{2 \text{ mowings/}}{\text{week}} \times \frac{52 \text{ weeks/}}{\text{year}} \times \frac{18 \text{ gallons diesel/}}{44 \text{ acre-mowing}} \times \frac{22.4 \text{ lbs } CO_2\text{/ gallon diesel}}{2204 \text{ lbs/ton}} = 0.43 \text{ MT } CO_2\text{/ acre-year}$$

5.10.4 Calculating CO_2 Emissions from Building Energy Use at the Golf Course

Any of the non-residential building energy use data sources described in the Buildings section may be used to estimate energy intensity at the golf course.

5.11 Pools

Recreation centers may include various pools, spas, and restroom buildings; ENVIRON assumes that pools are the main consumers of energy in recreation centers. This section describes the methods used to estimate the GHGs associated with pools in recreation centers.

The energy used to heat and maintain a swimming pool depends on several factors, including (but not limited to): whether the pool is indoors or outdoors, size of the pool (surface area and depth), water temperature, and energy efficiency of pool pump and water heater, and whether

solar heating is used. By making assumptions for these parameters and using known or predicted values for energy use, ENVIRON estimates the electricity and natural gas use of an outdoor pool.

5.11.1 Recreation Center Characterization

In the calculations described below, ENVIRON assumes that the proposed pools will be outdoor pools with dimensions 50 meters by 22.9 meters (a typical, competition-size pool). ENVIRON bases electricity calculations on a pool that ran its standard water filter for 24 hours per day, 365 days per year. As there is little data publicly available on the energy use of commercial swimming pools, ENVIRON extrapolates energy consumption from information obtained from two sources: 1) Data on electricity used by pool pumps from Pacific Gas and Electric (PG&E),[51] and 2) Data on the annual cost to heat a commercial pool located in Carlsbad, CA.[52]

5.11.2 Electricity Use of Pools

A PG&E study on energy efficiency of a pool pump at the Lyons Pool in Oakland, CA, found an annual electricity use of 110,400 kilowatt hours per year (kWh per yr).[53] The study pool is smaller than the assumed size of the proposed pool (actual size of the Lyons Pool is 35 yards by 16 yards). Accordingly, ENVIRON scales the electricity use to reflect the larger size of the proposed pool.

5.11.3 Natural Gas Use of Pools

The estimated annual cost of heating a standard competition-size pool is $184,400 (or 72% of the total cost of pool operations).[54] ENVIRON used the average PG&E commercial rate for natural gas of $0.95 per therm to convert this cost into annual natural gas use (hundred cubic feet per year [ccf/year]).[55] The commercial rate averages the variable cost due to energy usage and time of year. This corresponds to approximately 184,400 ccf per year.[56]

This value is comparable to that obtained from the pool industry.[57] The estimated cost of heating a residential pool using a natural gas heater is about one dollar per square foot of water

surface area per month ($/sqft-month) in residential therms.[58] Applying this value to a competition-size pool yields an annual natural gas use of 147,600 ccf/year.

5.11.4 Conversion of Electricity and Natural Gas Use to Greenhouse Gas Emissions

ENVIRON used utility-specific electricity and natural gas emission factors to calculate the total CO_2 emissions for each pool. A summary of the calculations is shown below:

$$Emissions\ from\ Electricity\left(\frac{Tonnes\ CO_2/yr}{1{,}000\,sqft}\right) =$$
$$\frac{Energy\ Use\,(ccf/yr) \times Emission\ Factor\,(lbs\ CO_2e/ccf) \times Conversion\ Factor\,(tonne/2205\,lbs)}{Surface\ Area\ of\ Pool\,(1{,}000\,sqft)}$$

$$Emissions\ from\ Natural\ Gas\left(\frac{Tonnes\ CO_2/yr}{1{,}000\,sqft}\right) =$$
$$\frac{Energy\ Use\,(ccf/yr) \times Emission\ Factor\,(lbs\ CO_2e/ccf) \times Conversion\ Factor\,(tonne/2205\,lbs)}{Surface\ Area\ of\ Pool\,(1{,}000\,sqft)}$$

[58] The residential price for one therm of natural gas.

Transportation Appendices

Appendix C.1

Transportation Calculations

Appendix C.1 – Transportation Calculations

Table C-1 provides further detail into the calculations of percent reduction in vehicle miles traveled (VMT) for each of the fact sheets (that have references to the appendix). Many of the strategies in the table below do not provide the full equations for percent reduction in vehicle miles traveled. Only the equations or variables which require further detail are outlined here. The table also provides detail on any assumptions which are made to perform the calculations and the basis of such assumptions. An additional section below Table C-1 provides a detailed discussion of the calculations made for the transit accessibility strategy.

Provide Employer-Sponsored Vanpool/Shuttle (Trip Reduction Programs)	E8	C = Adjustment from vanpool mode share to commute VMT	--	0.67	see Increase Transit Accessibility
Implement Bike-Sharing Programs (Trip Reduction Programs)	E10	% VMT Reduction = A * B * C = 2% * 7% * 20% = 0.03%	--	--	--
		A = 2% = Net new bicycle mode share = (existing mode share * % increase in bicycle mode share) – existing mode share	Existing mode share	Estimate at 1%	Pucher et al., 2010
			% increase in bicycle mode share	135 – 300%	Pucher et al., 2010, Table 4 (see fact sheet for calculations)
		B = % of new bicycle trips shifting from vehicles (from literature)	--	6-7%	Pucher et al., 2010 and Bike-Share in NYC, 2009, Table 4, p.45
		C = adjustments to convert from vehicle mode share to VMT * adjustment for shorter than average trip lengths = 1*20%	adjustments to convert from vehicle mode share to VMT	1	Assume all trip lengths are equal (vehicle mode share to vehicle trips to VMT) [i]
			adjustment for shorter than average trip lengths	1.94/9.9 = 20%	Adjustment to reflect ratio of bike trip length to average trip length (this strategy will only replace the shorter vehicle trips that can be reasonably replaced by a bicycle). [1.94 miles (average bike trip length from Moving Cooler Appendices B-28 referencing NHTS) / 9.9 miles (average household trip length from NHTS Transferability, 2001 NHTS, http://nhts-gis.ornl.gov/transferability/Default.aspx)]

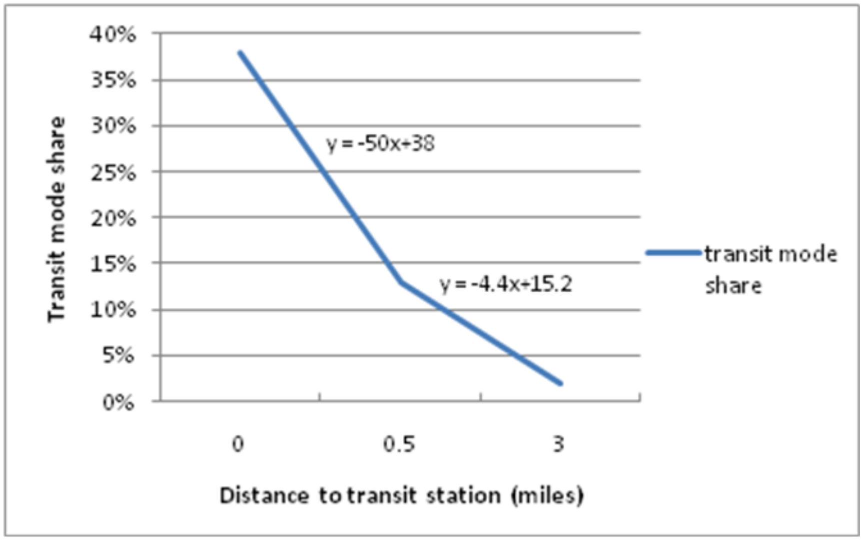
Table C-1 Transportation Calculations					
Strategy	**T#**	**Equation**	**Variable**	**Value**	**Source/Notes**
Provide End of Trip Facilities (Trip Reduction Programs)	E11	*utilizing the same equation in bike sharing program section, set A = 1.3% = (7.1% - 5.8%) % VMT Reduction = A * B * C = 1.3% * 7% * 20% = 0.02%	--	--	--
Establish Schoolpool (Trip Reduction Programs)	E13	B = Adjustments to convert from participation to daily VMT to annual school VMT = [(avg # of families per carpool - 1) / avg # of families per carpool] *% of school days	avg # of families per carpool	2.5	TDM Case Studies, DRCOG, p.13
			% of school days	75% = 39 school weeks/ 52 weeks	TDM Case Studies, DRCOG, p.13
Provide School Buses (Trip Reduction Programs)	E14	B = Adjustments to convert from participation to daily VMT to annual school VMT = % of school days	% of school days	75% = 39 school weeks/ 52 weeks	TDM Case Studies, DRCOG, p.13
Cordon Pricing (Road Pricing Management)	F2	A = % increase in pricing for passenger vehicles to cross cordon	--	100 – 500%	*Moving Cooler* uses peak hour price per mile instead of crossing price. The percentage change can still be calculated to provide a general estimate for a high range % change. Assuming a baseline of $0.10, calculated percentage increase to $0.49 - $0.65 (*Moving Cooler*) and adjusted with rounding
		C = % of VMT Impacted by Cordon Pricing and Mode Shift Adjustments = %VMT impacted by congestion pricing * Mode shift adjustment = 8.8% (peak period) and 21% (all day)	--	--	--

Table C-1 Transportation Calculations					
Strategy	**T#**	**Equation**	**Variable**	**Value**	**Source/Notes**
		Peak period = 25% * 35% = 8%	%VMT impacted by congestion pricing	25%	20% of trips are work trips (NHTS Transferability, 2001 NHTS, http://nhts-gis.ornl.gov/transferability/Default.aspx) and round up assuming other trips travel during peak periods
			Mode shift adjustment	35% = 20% + 30%/2	Of the estimated trips affected to the increase in price, assume 50% is either a time of day shift/route shift/no change, 30% convert to HOV trips (with average 2 ppl per HOV), and 20% are trip reductions/shift to transit, walk or bike
		Static all day price (London) = 60% * 35% = 21%	% VMT impacted by congestion pricing	60%	Conservatively assume 60% of trips fall in the peak periods and mid-day
			Mode shift adjustment	35%= 20% + 30%/2	Of the estimated reduced trips due to the increase in price, assume 50% is either a time of day shift/route shift/no change, 30% convert to HOV trips (with average 2 people per HOV), and 20% are trip reductions/shift to transit, walk or bike

Increase Transit Accessibility (Land Use/Location)

Distance to transit	Transit mode share calculation equation (where x = distance of project to transit)
0 – 0.5 miles	-50*x + 38

0.5 to 3 miles	-4.4*x + 15.2
> 3 miles	no impact
Source: Lund et al, 2004; Fehr & Peers 2010	



Data was taken from Table 5-25 of Lund et al, 2004. The table provided transit commute mode shares for those living with ½ mile of a rail station for 5 sites surveyed within California. Removing the extreme low and high percentages, this provided a range of transit commute mode share of 13% to 38%. A simple linear extrapolation was conducted to provide a relationship for distance to transit (between 0 and ½ mile) to transit mode share, via the equation: transit mode share = -50 * distance to transit + 38. The table also provided transit mode shares for those living from ½ to 3 miles from a station, a range from 2% to 13%. Using the same methodology, a relationship for distance to transit (between ½ mile and 3 miles) to transit mode share is provided via the equation: transit mode share = -4.4x + 15.2.

Appendix C.2

Trip Adjustment Factors

Appendix C.2 – Trip Adjustment Factors

The trip adjustment factors are not explicitly used for calculations of reduction in vehicle miles traveled (VMT) but serve as an added resource point for users of this document. For example, we report all commute trip reduction (CTR) program strategies as a percentage reduction in commute VMT. If the user would like to translate this to project level VMT (assuming the project is NOT an office park), and the user does not have statistics about the project area readily available, then the trip adjustment factors table can be utilized.

Example: Assume the user is providing a 15% reduction in commute VMT for a implementation of a ride share program. To calculate an estimated reduction in project level VMT, the user can multiple 15% by 20% (NHTS average % of work trips) and again multiply by 12.0 / 9.9 (average work trip length/average trip length) to adjust for both the portion of trips which are work related and that work trips tend to be longer than average trips.

TABLE C-2. TRIP ADJUSTMENT FACTORS

	NHTS[1]	Sacramento Region[2]	San Diego Region [3]	Rural (Kings County, CA) [4]
Average Work Trip Length (vehicle)	12.0	10.4	8.4	-
Average Trip Length (vehicle)	9.9	6.8	6.9	8.7
Average % of Work Trips	20%	20%	-	12%
Average % of School Trips	9.8%	-	-	-
Average Length of School Trips (Vehicle)	6.0	-	4.2	-
Average Vehicle Occupancy (All Trips)	1.5	1.4	1.5	-

Appendix C.3

Induced Travel Memo

FEHR & PEERS
TRANSPORTATION CONSULTANTS

MEMORANDUM

Date: February 3, 2010

To: CAPCOA Team

From: Tien-Tien Chan, Jerry Walters, and Meghan Mitman

Subject: Induced Travel Material

SF10-0475

Induced travel is a term used to describe how travel demand responds to roadway capacity expansion and roadway improvements. Consistent with the theory of supply and demand, the general topic of research concerning induced travel is that reducing the cost of travel (i.e., reduced travel time due to a new road improvement) will increase the amount of travel. In other words, road improvements alone can prompt traffic increases. To what degree and under what circumstances these increases occur is a matter of debate and the key subject of most induced travel research. We have attached the following documents which represent research on induced travel effects:

- *Comparative Evaluations on the Elasticity of Travel Demand* – study conducted for the Utah DOT which included national literature review of induced travel studies
- *Are Induced-Travel Studies Inducing Bad Investments?* – article by Cervero in Access Magazine: Transportation Research at the University of California
- *Road Expansion, Urban Growth, Growth, and Induced Travel: A Path Analysis* – APA Journal paper by Cervero, also discusses the impacts of induced growth and induced investments

The reader should be aware that conditions may vary considerably and the extent of induced travel depends on a variety of factors, including: the degree of prior congestion in the corridor, its duration over hours of the day, its extent over lane miles of the corridor, the degree to which un-served traffic diverts to local streets and the degree of congestion on those routes, the availability of alternate modes within the corridor, whether corridor is radial and oriented toward downtown with high parking cost and limited availability or circumferential, planned level of growth in the corridor, whether the corridor is interstate or interregional, whether it is a truck route, and other factors.

GHG reduction strategies such as transportation system management (e.g. signal coordination, adaptive signal control) may also have the potential for inducing travel. For such strategies, if the estimated improvement exceeds 10% benefit in travel time reduction, we recommend conducting project specific analysis on induced travel prior to establishing GHG reduction benefits.

Appendix D

Building Mitigation Measure Quantification Methods

This Appendix summarizes the steps and assumptions used in two of the mitigation strategies – exceed Title 24 energy efficiency standards (BE-1) and installing energy efficient appliances (BE-4).

Background

GHGs are emitted as a result of activities in residential and commercial buildings when electricity and natural gas are used as energy sources. New California buildings must be designed to meet the building energy efficiency standards of Title 24, also known as the California Building Standards Code. Title 24 Part 6 regulates energy uses including space heating and cooling, hot water heating, ventilation, and hard-wired lighting. By committing to a percent improvement over Title 24, a development reduces its energy use and resulting GHG emissions.

The Title 24 standards have been updated twice (in 2005 and 2008)[1] since some of these data used to estimate energy use were compiled. California Energy Commission (CEC) has published reports estimating the percentage deductions in energy use resulting from these new standards. Based on CEC's discussion on average savings for Title 24 improvements, these CEC savings percentages by end use can be used to account for reductions in electricity and natural gas use due to the two most recent updates to Title 24. Since energy use for each different system type (ie, heating, cooling, water heating, and ventilation) as well as appliances is defined in this survey, the use of survey data with updates for Title 24 will easily allow for application of mitigation measures aimed at reducing the energy use of these devices in a prescriptive manner.

Another mitigation measure to reduce a building's energy consumption as well as the associated GHG emissions from natural gas combustion and electricity production is to use energy-efficient appliances. For residential dwellings, typical builder-supplied appliances include refrigerators and dishwashers. Clothes washers and ceiling fans would be applicable if the builder supplied them. For commercial land uses, only energy-efficient refrigerators have been evaluated for grocery stores.

California Energy Commission. 2006. California Commercial End-Use Survey. Prepared by Itron Inc. Available at: http://www.energy.ca.gov/ceus/

Methodology

Datasets

The Residential Appliance Saturation Survey (RASS)[2] and California Commercial Energy Use Survey (CEUS)[3] datasets were used to estimate the energy intensities of residential and non-residential buildings, respectively, since the data is available for several land use categories in different climate zones in California. The RASS dataset further differentiates the energy use intensities between single-family, multi-family and townhome residences.

The Energy Star and Other Climate Protection Partnerships 2008 Annual Report[4] and subsequent Annual Reports were reviewed for typical reductions for energy-efficient appliances. ENERGY STAR residential refrigerators, clothes washers, dishwashers, and ceiling fans use 15%, 25%, 40%, and 50% less electricity than standard appliances, respectively. ENERGY STAR commercial refrigerators use 35% less electricity than standard appliances.

Calculations

Exceeding Title 24 Energy Efficiency Standards (BE-1)

RASS and CEUS datasets were used to obtain the energy intensities of different end use categories for different building types in different climate zones. Energy intensities from CEUS are given per square foot per year and used as presented. RASS presents Unit Energy Consumption (UEC) per dwelling unit per year and saturation values; the energy intensities used in this analysis are products of the UEC and saturation values.

Data for some climate zones is not presented in the CEUS and RASS studies. However, data from adjacent climate zones is assumed to be representative and substituted as follows:

For non-residential building types:
Climate Zone 11 used Climate Zone 9 data.
Climate Zone 12 used Climate Zone 9 data.
Climate Zone 14 used Climate Zone 1 data.
Climate Zone 15 used Climate Zone 10 data.

For residential building types:
Climate Zone 6 used Climate Zone 2 data.
Climate Zone 14 used Climate Zone 1 data.
Climate Zone 15 used Climate Zone 10 data.

RASS and CEUS data are based on 2002 consumption data. Because older buildings tend to be less energy efficient, and the majority of the buildings in the survey were likely constructed

3 California Energy Commission. 2006. California Commercial End-Use Survey. Prepared by Itron Inc. Available at: http://www.energy.ca.gov/ceus/
4 United States Environmental Protection Agency 2009. ENERGY STAR and Other Climate Protection Partnerships: 2008 Annual Report. Available at: http://www.epa.gov/cpd/pdf/2008AnnualReportFinal.pdf

before 2001, the RASS and CEUS data likely overestimate energy use for a 2001 Title 24-compliant building.

To account for updates since the 2001 Title 24 standards, percentage reductions for each end use category taken directly from the CEC's "Impact Analysis for 2005 Energy Efficiency Standards" and "Impact Analysis 2008 Update to the California Energy Efficiency Standards for Residential and Nonresidential Buildings" reports were applied to the CEUS and RASS datasets for improvements from 2001 to 2005, and 2005 to 2008, respectively (see Tables D-1 and D-2). For the CEUS data, exterior lighting was assumed to be covered by Title 24 lighting and therefore has the full percentage reductions taken. Interior lighting was assumed to be 50% Title 24 and 50% non-Title 24 uses. Therefore only half of the reduction for lighting was applied. The resulting 2008 numbers were then used as baseline energy intensities for this mitigation strategy. The total baseline energy intensities are calculated as follows:

$$\text{Baseline} = \sum\left[\mathrm{T24}_{2001} \times \left(1 - \mathrm{R}_{2001\text{-}2005}\right) \times \left(1 - \mathrm{R}_{2005\text{-}2008}\right)\right] + \sum \mathrm{NT24}$$

Where:

Baseline	=	Total baseline energy intensities of building category
$T24_{2001}$	=	Energy intensities of Title 24 regulated end use from RASS or CEUS
$R_{2001\text{-}2005}$	=	Reduction from 2001 to 2005
$R_{2005\text{-}2008}$	=	Reduction from 2005 to 2008
NT24	=	Non-Title 24 regulated end use energy intensities

Table D-1

Reduction in Title 24 Regulated End Use for Non-Residential Buildings

Energy Source	End Use	Reduction from 2001 to 2005	Reduction from 2005 to 2008
Electricity	Heating	4.9%	37.2%
	Ventilation	5.0%	1.5%

The same approach was used to quantify GHGs emission reduction from exceeding Title 24 energy efficiency standards by 1%. The 1% reduction was applied to only energy use intensities for Title 24 regulated end use categories. For the CEUS data, the reduction was not applied to any portion of interior lighting. The reduced energy use intensities were added to the unadjusted energy use intensities for non-Title 24 regulated end use categories to obtain the total energy use intensities for exceeding Title 24 energy efficiency standards by 1% for each building category. These were then compared to the baseline line energy intensities for the overall percentage reduction as follows:

$$\text{Percentage Reduction} = 1 - \frac{\sum\left[T24_{2001} \times \left(1 - R_{2001\text{-}2005}\right) \times \left(1 - R_{2005\text{-}2008}\right) \times 99\%\right] + \sum NT24}{\text{Baseline}}$$

Where:

Baseline	=	Total baseline energy intensities of building category
$T24_{2001}$	=	Energy intensities of Title 24 regulated end use from RASS or CEUS
$R_{2001\text{-}2005}$	=	Reduction from 2001 to 2005
$R_{2005\text{-}2008}$	=	Reduction from 2005 to 2008
NT24	=	Non-Title 24 regulated end use energy intensities

Installing Energy Efficient Appliances

The same baseline line energy use intensities from the Exceeding Title 24 Energy Efficiency Standards mitigation were used for this mitigation strategy. For all appliances except ceiling fan, the reductions as presented in the ENERGY STAR 2008 annual report were applied to the energy use intensities of the corresponding energy end use categories. All other end use categories were kept unadjusted. The percentage reductions were calculated as follows:

$$\text{Percentage Reduction} = 1 - \frac{\text{Appliance Intensity} \times \left(1 - ESR\right) + \sum \text{Other End Use}}{\text{Baseline}}$$

Where:

Baseline	=	Total baseline energy intensities of building category
Appliance Intensity	=	2008 baseline energy intensity of appliance in consideration
ESR	=	Reduction from ENERGY STAR appliance
Other End Use	=	2008 baseline energy intensity of all other end uses

RASS does not specify a ceiling fan end-use; rather, electricity use from ceiling fans is accounted for in the “Miscellaneous” category which includes interior lighting, attic fans, and other miscellaneous plug-in loads. Since the electricity usage of ceiling fans alone is not specified, a value from the National Renewable Energy Laboratory (NREL) Building American Research Benchmark Definition (BARBD)[5] was used. BARBD reported that the average energy use per ceiling fan is 84.1 kWh per year. In this mitigation measure, it was assumed that each multi-family, single-family, and townhome residence has one ceiling fan. Therefore, the 50% reduction from ENERGY STAR for ceiling fan was applied to 84.1 kWh of the electricity attributed to the Miscellaneous RASS category. In other words, 42.05 kWh was subtracted from the electricity end use intensities of the "Miscellaneous RASS" category in evaluating the GHGs emission reduction from installing energy efficient ceiling fans.

The total energy use intensities with reduction from each appliance in consideration were then compared to the baseline line energy intensities for the overall percentage reduction as follows:

$$\text{Percentage Reduction} = 1 - \frac{(\text{Misc} - 42.05) + \sum \text{Other End Use}}{\text{Baseline}}$$

Where:

Baseline = Total baseline energy intensities of building category
Misc = 2008 energy intensity in Miscellaneous category for electricity
Other End Use = 2008 baseline energy intensity of all other end uses

1.0 INTRODUCTION

The Salinas Annexation Project Area (Project) area is located east of the City of Salinas in Monterey County, California. The Project area is located north of Williams Road, between Boronda Road, Old Stage Road and San Juan Grade Road (Figure 1). The Project area encompasses approximately 2,400 acres, the majority of which is currently in row crop agriculture. Some areas support greenhouses and one area, along Old Stage Road, is undeveloped grassland that is grazed by cattle and horses. The Project area is under consideration for annexation by the City of Salinas and subsequent residential and commercial development. Three specific plans, addressing the west, central and east areas, are currently being developed for the 2,400-acre Project area.

An assessment of the biological resources within the Project area was conducted between March and November 2004 by Kathleen Lyons (plant ecologist) and Bryan Mori (wildlife biologist). The focus of the assessment was to identify the existing biological resources, including sensitive species and/or habitat, within the Project area. This information will be used at a future date to evaluate the proposed Project as per CEQA requirements.

Specific tasks conducted for the Existing Biological Resources Report include:

- Characterizing the major plant communities within Project area;
- Identifying potential sensitive biotic resources, including plant and wildlife species of concern, within the proposed Project area pursuant to existing City of Salinas General Plan policies and other applicable policies/regulations of State and Federal agencies.

2.0 METHODOLOGY

The biotic resources of the 2,400-acre Project area were assessed through field observations between March and November 2004. The assessment covered all areas within the 2,400-acre Project area, except for parcels where access was not obtained; these include the Christiansen, Gabilan Knights, Calleros and Carlos parcels. To assess the potential occurrence of special status biotic resources, two electronic databases were accessed to determine recorded occurrences of sensitive plant communities and sensitive species. Information was obtained from the California Native Plant Society's (CNPS) Electronic Inventory (2004) and California Department of Fish and Game's (CDFG) Rarefind 3 database (CDFG, 2004a) for the U.S.G.S. Natividad quadrangle and adjacent quadrangles: Salinas, Hollister, Prunedale, Marina, Seaside, Spreckels, Chualar, San Juan Bautista and Salinas. Previous biological reports for portions of the proposed annexation area were also reviewed. This report summarizes the findings of the biotic assessment and special status plant and animal surveys.

2.1 Botanical Resource Assessment

The major plant communities within the Project area, based on the classification system maintained by California Department of Fish and Game (CDFG, 2003a) (and amended to reflect site conditions) were identified during field visits and a review of aerial photographs. The distribution of the major plant community types within the Project area, depicted onto a topographic base map, is presented in Figures 2 and 3. Figure 2 depicts the location of special status plant species. Kathleen Lyons, plant ecologist with Biotic Resources Group, and a field assistant conducted floristic surveys of the Project area over seven days in 2004: 26 and 31 March, 14 and 30 April, 17

May, 17 June, and 26 July, which covers the blooming period of the special status plant species with potential to occur in the area. The field surveys consisted of walking the non-row crop portions of the Project area, recording plant species and identifying plant community types. Plant species observed during the survey are listed in Appendix A. Plant nomenclature is according to *Jepson Manual* (Hickman, 1993) and *An Illustrated Field Key to the Flowering Plants of Monterey County* (Matthews, 1997).

2.2 Wildlife Resource Assessment

The wildlife habitat assessment was performed for nearly all areas of the 2,400-acre study site, except for parcels where access was not obtained (i.e., Christiansen, Gabilan Knights, Calleros and Carlos parcels). Where possible, habitat conditions on these parcels were assessed through observations made from adjacent areas. The wildlife assessment included protocol-level surveys for California tiger salamander (*Ambystoma californiense*) and burrowing owl (*Athene cunicularia*) (see below), based on habitat conditions observed during a preliminary site visit of the study area, and prior knowledge of the project region (Bryan Mori Biological Consulting Services and Biotic Resources Group, 2003). In the course of conducting the focused surveys, a habitat assessment for other special-status species also was performed. Habitats and all wildlife species observed were recorded in a field notebook. A list of wildlife species observed is presented in Appendix B. In addition to the field studies, a review of relevant literature and CNDDB records for the Natividad, Prunedale and Salinas Quads (CDFG 2004a) was performed, along with consultations with other biologists, to obtain information on wildlife occurrences in the project area. Wildlife resources are depicted on Figures 4 and 5.

2.2.1 California Tiger Salamander (CTS) Assessment and Survey. The CTS assessment was performed, following the protocol - *Interim Guidance on Site Assessment for Determining the Presence or a Negative Finding of the California Tiger Salamander, October 2003* (USFWS and CDFG, 2003). The protocol includes a habitat assessment, spring surveys for two consecutive years, and an intervening winter drift fence study *if* the initial spring surveys result in negative findings. For the purposes of this study, surveys for CTS were limited to spring larval sampling in 2004, due to the uncertainty of the federal listing status of CTS during the course of this study.

2.2.1.1 Habitat Assessment. The existing habitat conditions of the Project area and within 1.24 miles of the site were initially evaluated during a preliminary reconnaissance of the 2,400-acre Project area on 10 February 2004. The 2,400–acre area was cursorily evaluated by driving the perimeter of the site, as well as through interpretation of the USGS Natividad quadrangle and a 1"= 500' scale aerial map. Additional information also was derived from observations during focused surveys performed in 2002-03 for Creekbridge Homes on a 600-acre site located within the current study area (Bryan Mori Biological Consulting Services and Biotic Resources Group 2003). The CNDDB was accessed for information on CTS locations within 3.1 miles of the project site. Other sources for CTS records included relevant biological assessments and consultation with other biologists. A preliminary habitat assessment incorporating the above information was provided to the USFWS and CDFG as part of a notification letter-report to conduct spring aquatic sampling on the project site for this study, per protocol requirements (Bryan Mori Biological Consulting Services, letter dated 30 March 2004).

2.2.1.2 Spring Aquatic Surveys. Initially, CTS aquatic surveys were performed on a limited portion of the study site in spring of 2002 and 2003, as part of a separate biological constraints analysis performed on the 600-acre Creekbridge Homes site, referenced above. The 2002-03 CTS study was conducted following the protocol in affect at that time - *Inland Fisheries Informational Leaflet No. 44, Survey Protocol for California Tiger Salamander (Ambystoma californiense)* (CDFG 1997). Two agricultural ponds and portions of Natividad Creek and an unnamed drainage were sampled, using a combination of dipnets, seine and minnow traps, but no larvae were observed over the two spring seasons. However, an adult, road-kill tiger salamander was observed adjacent to the site on Old Stage Road during the intervening winter upland survey (Bryan Mori Biological Consulting Services and Biotic Resources Group 2003). The aquatic sites sampled in 2002-03 were not sampled during the course of this study, due to the negative results obtained and because the two ponds were removed by the property owner shortly after the 2002 spring sampling.

For this study, two agricultural ponds (Ponds 1 and 2) and portions of an unnamed tributary drainage to Natividad Creek were surveyed for CTS larvae (Figure 4). Under the current protocol, three spring larval surveys are required at each aquatic site, with one survey performed each month from March through May, however, surveys should cease when the presence of larvae is confirmed. Ponds 1 and 2 were sampled on 7 April and 19 May 2004, while the drainage was sampled on 8 and 26 April, and 12 May 2004. A March survey of the aquatic sites was not performed due to the late start of the study. Consequently, two surveys were scheduled in April to increase sampling effort. Ponds 1 and 2 were sampled twice due to the early confirmation of tiger salamander larvae; the presence of tiger salamander larvae was established at these ponds on 7 April, and an additional survey was performed on 19 May in association with Ben Fitzpatrick (UC Davis) to collect tissue samples for DNA analysis, in order to determine the taxonomic status of the tiger salamanders present. A combination of dipnets and seines were used for sampling at all aquatic sites. At each sampling site, the habitat was photographed, and general habitat characteristics observed and species collected were recorded in a field notebook. The details of the CTS surveys are presented as a separate document that was submitted to the USFWS, per protocol (Bryan Mori Biological Consulting Services 2005).

2.2.2 Burrowing Owl Assessment. The burrowing owl assessment was performed following the *Burrowing Owl Survey Protocol and Mitigation Guidelines* (California Burrowing Owl Consortium 1993). The assessment involved reconnaissance surveys to identify potential habitat and focused nesting season surveys of potential habitat. The habitat assessment was conducted over six days from 7 April to 12 May 2004. The entire site was driven and/or traversed on foot to locate areas of ground squirrel burrow concentrations and optimal foraging habitat; burrow concentration areas are depicted on Figure 4. Surveys for nesting burrowing owls were focused on areas supporting burrow concentrations, which were mostly located in remnant grassland patches on the Andrus and First Baptist Church parcels (Figure 4). The nesting surveys were conducted on 22, 26, 28, and 29 April and 19, 20, 24 and 27 May 2004 from approximately 45 minutes before sunrise until two hours after sunrise. All bird species observed during the surveys were recorded in a field notebook.

3.0 EXISTING BIOTIC RESOURCES

The study site encompasses 2,400 acres and is located immediately adjacent to the northeastern limits of the City of Salinas, California (Figure 1). The project site is dominated by row-crop agriculture, but other habitats are present within the agricultural matrix and include remnant patches of annual grassland and oak woodlands, ruderal (weedy) fields, eucalyptus groves, riparian vegetation along Gabilan Creek, Natividad Creek and unnamed tributaries, and aquatic habitat in irrigation ponds. In addition to agriculture, other land uses within the project site include cattle grazing, horse pastures, rural residential development, a school and a church.

Eleven plant community types were documented within the 2,400-acre Project area. The distribution of vegetation by general habitat type is depicted on Figures 2 and 3, Existing Plant Community Types. These vegetation types can be further distinguished into plant associations. The plant associations, as recognized by CDFG, that most closely resemble site conditions within the Project Area are listed below in Table 1. Vegetation Types within Salinas Annexation Project Area.

Table 1. Vegetation Types within Salinas Annexation Project Area

CNDDB Code	General Plant Community Type (As mapped on Figure 2)	Plant Association
Developed/Cultivated Areas		
-	Agricultural Fields	None
Grassland		
41.150.00*	Native Grassland*	Purple Needlegrass *(Nassella pulchra)*
42.026.00	Non-native Grassland	Ripgut Brome – Soft Chess *(Bromus diandrus – Bromus hordeaceus)*
45.300.00	Wet Meadow	Meadow Barley – Rabbitsfoot Grass – Spikerush *(Hordeum branchyantherum- Polypogon monspeliensis – Eleocharis macrostacyha)*
-	Ruderal	Poison Hemlock – Wild Radish *(Conium maculatum – Raphanus sativa)*
Scrub		
32.060.09	Coyote Brush Scrub	Coyote Brush/Annual Grasses *(Baccharis pilularis – Bromus* spp.)
Riparian and Ponds		
61.201.00*	Willow Riparian*	Arroyo Willow – Shining Willow *(Salix lasiolepis – Salix lucida)*
61.000.00	Herbaceous Riparian	Watercress- curly dock -nutgrass *(Rorrippa nasturtium-aquaticum - Rumex crispus- Cyperus eragrostis)*,
52.101.00*	Freshwater Marsh*	California Bulrush - Water Smartweed *(Scirpus californicus - Polygonum persicaria)*
Woodland		
71.060.09	Oak Woodland	Coast Live Oak/Grass *(Quercus agrifolia/ Bromus spp.)*
-	Landscape Tree Groves	Eucalyptus – Monterey Pine *(Eucalyptus* sp. – *Pinus radiata)*

* Plant associations considered rare and worthy of consideration by CNDDB, May 2002

The study area is expected to support a wide variety of wildlife, including various special-status species, due to the combination of the following factors: 1) the large size of the study area (2,400 acres); 2) the presence of remnant patches of habitat with high wildlife value on the study site; 3) the general lack of permanent development; and 4) the continuity/close proximity of the study site to relatively undeveloped landscapes east of Old Stage Road. The following text provides a general discussion of the principal habitats in the study area, their botanical resources and their value to native wildlife.

3.1 Agricultural Fields

The majority of the 2,400-acre Project area is in intensive row-crop production. During the course of the study, agricultural activities were occurring, with periodic changes in crops and tilled land area. Figures 2 and 3 depict the areas in active agriculture (i.e., row-crops, tilled fields or greenhouses) as of July 2004. Typical crops include strawberries and lettuce.

3.1.1 Wildlife Resources of Agricultural Fields

Wildlife use of agricultural fields is largely limited to opportunistic foraging by blackbirds, ground squirrels and hares, due to frequent disturbances from farming activities. However, the habitat values will vary depending on the frequency of disturbances and crop type. For example, fallow fields may temporarily support a level of use similar to that of grasslands, when allowed to produce ruderal vegetation, and perennial crops, such as strawberry fields, may even support nesting by killdeer (*Charadrius vociferus*) and horned larks, which prefer the bare areas between the rows.

3.2 Grasslands

Four grassland types were observed within the 2,400-acre Project area: native grassland, non-native grassland, wet meadow and ruderal grassland. As depicted on Figure 2, non-native grassland, a grassland type dominated by annual, non-native plant species, is the dominant grassland type, with the largest area occurring southwest of a portion of Old Stage Road. Patches of native grassland, a grassland type dominated by native plant species, was found in scattered locations in this area, as depicted on Figure 2. The Project area also supports depressions that are considered wet meadow. Ruderal (weedy) grassland areas were found in previously disturbed areas, primarily alongside the various drainage channels within the Project area.

3.2.1 Non-native Grassland. This grassland type is characterized by the dominance of annual, non-native grasses. Within the Project area, this grassland type is most prevalent southwest of Old Stage Road on the Wayland and Andruss properties (Figure 2). The grassland is dominated by ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), rattail fescue (*Vulpia myuros*), and foxtail barley (*Hordeum leporinum*). Other grasses include Italian ryegrass (*Lolium multiflorum*), wild oat (*Avena* sp.), and quaking grass (*Briza minor*). Non-native forbs are prevalent in the grassland, including windmill pink (*Silene gallica*), bindweed (*Convolvulus arvensis*), bur clover (*Medicago polymorpha*), white-stemmed filaree (*Erodium moshatum*), sheep sorrel (*Rumex acetosella*), rough cat's ear (*Hypochoeris radicata*), hop clover (*Trifolium campestre*), rose clover (*Trifolium hirtum*), red-stemmed filaree (*Erodium cicutarium*), long-beaked filaree (*Erodium botrys*), shepard's purse (*Capsella bursa-pastoris*), scarlet pimpernel (*Anagallis arvensis*), bristly ox-tongue (*Picris echioides*), and smooth cat's ear (*Hypochoeris glabra*). Native forbs observed within the grassland include California poppy (*Eshscholzia californica*), red maids (*Calandrinia ciliata*), Lindley's annual lupine (*Lupinus bicolor*), pink owl's clover (*Castilleja exserta*), green fiddleneck (*Amsinkia vernicosa*), hill morning glory (*Calystegia subcaulis*), coast tarweed

(*Hemizonia corymbosa)*, slender tarweed (*Madia gracilis)*, western rush (*Juncus occidentalis)*, and common fiddleneck (*Amsinkia menziesii var. intermedia)*. The character of the annual grassland is depicted on Figure 6.

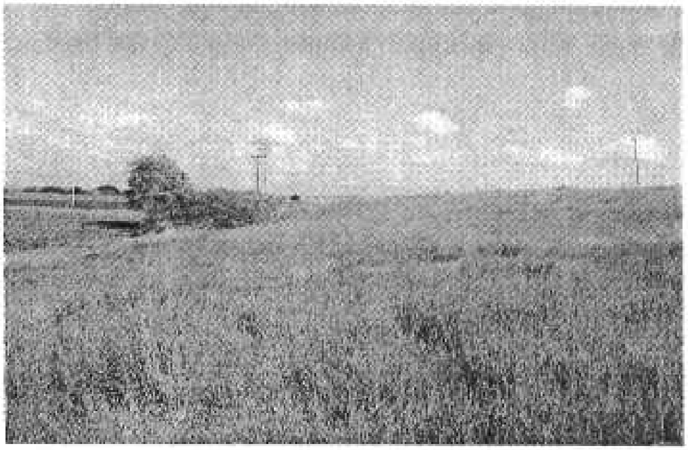

Figure 6. Annual Grassland within Project Area, April 2004.

Individuals of Congdon's tarplant (*Centromadia parryi ssp. congdonii)*, a rare plant species, were observed within the grasslands of the Project area. As depicted on Figure 2, three patches of the tarplant were documented from the project site. One of the patches is located in a previously disturbed upland area. At this location, the tarplant was observed growing amid wild mustard (*Brassica* sp.), and non-native grasses. Approximately 500 individuals of Congdon's tarplant were observed in this area (see Section 4.2 for more information on this species).

3.2.2 Native Grassland. This plant community type is characterized by the dominance by native grasses and forbs. Within the project area, areas of this vegetation type are limited to two small remnant patches on sloping, non-agricultural lands. One patch is located adjacent to Old Stage Road; the second patch is on a hillside south of Natividad Creek (Figure 2). The native grassland areas are noticeable by the growth purple needlegrass (*Nassella pulchra)*, blue wild rye (*Elymus glaucus)*, narrow-leaved mule ears (*Wyethia angustifolia)*, golden brodiaea (*Triteleia ixioides)*, annual lupine (*Lupinus nanus)*, blue-eyed grass (*Sisyrinchium bellum)*, soap plant (*Chlorogalum pomeridianum)*, California brome (*Bromus carinatus)*, and sun cups (*Camissonia ovata)*. The grassland near Natividad Creek also supports a dense patch of California oatgrass (*Danthonia californica)*. The character of the two native grassland areas is depicted in Figures 7 and 8.

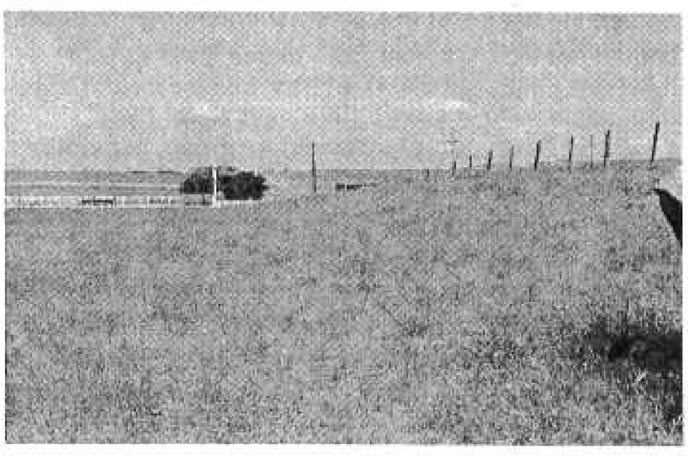

Figure 7. View of native grassland west of Old Stage Road, April 2004, showing growth of purple needlegrass.

Figure 8. Native grassland area on slope south of Natividad Creek, April 2004, with mule's ears, California oatgrass, purple needlegrass and blue wild rye.

3.2.3 Wet Meadow. The Project area supports scattered wet meadow areas. The wet meadows inhabit depressions and small swales within the grassland where winter rainfall and surface runoff collects. The wet meadow areas were observed to support plants tolerant of seasonally high soil moisture, including rabbitsfoot grass, meadow barley *(Hordeum branchyantherum)*, heliotrope *(Heliotropium curassavicum)*, curly dock, Italian ryegrass, bitter dock *(Rumex obtusifolius)* and western rush. Spikerush *(Eleocharis macrostatya)* was observed in a wetland swale west of Old Stage Road. The character of wet meadow grassland is depicted in Figure 9.

Individuals of Congdon's tarplant, a rare plant species, were observed within slight depressions within the grasslands of the Project area. As depicted on Figure 2, three patches of the tarplant were documented from the Project area. Two of the patches were observed in slight depressions in otherwise non-native grassland. The depression topography, coupled by observations of previously saturated soils, suggest these areas meet the definition of wet meadow areas. In addition to individuals of Congdon's tarplant, the areas were dominated by Italian ryegrass, curly dock, and western rush. Other plant species include foxtail barley and quaking grass. Approximately 1,500 individuals of Congdon's tarplant were observed in these two areas. (See Section 4.2 for more information on this species).

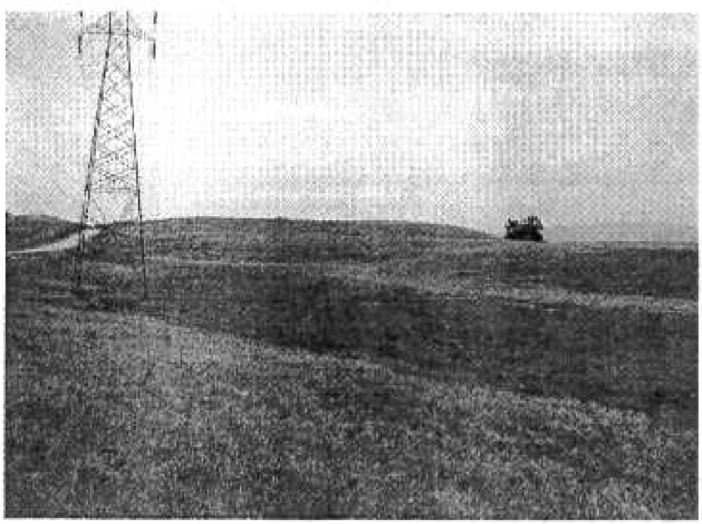

Figure 9. View of wet meadow grassland within swale west of Old Stage Road, April 2004.

3.2.4 Ruderal Grassland. The Project area supports many areas that are periodically disturbed by adjacent agricultural activities, such as clearing, mowing or placement of farm equipment. Herbaceous and semi-woody plants typical of disturbed conditions dominate these areas, such as strips of land between agricultural roads and riparian woodland along Gabilan and Natividad Creeks. These "ruderal" areas are comprised of non-native plant species such as poison hemlock (*Conium maculatum)*, sow thistle (*Sonchus asper)*, fennel (*Foeniculum vulgare)*, wild radish (*Raphanus sativa)*, wild mustard (*Brassica* sp.), bull mallow (*Malva neglecta)*, knotweed (*Polygonum aviculare)*, English plantain (*Plantago lanceolata)*, Italian thistle (*Carduus pycnocephala)*, peppergrass (*Lepidium densiflorum)*, yellow sweet clover (*Melilotus indica)*, and bur clover (*Medicago polymorpha)*. The character of ruderal grassland is depicted in Figure 10.

3.2.5 Wildlife Resources of Grasslands. Noteworthy patches of grassland habitat are largely confined to the Andrus and Wayland parcels along the eastern edge of the study area. In general, since the 1800s, grasslands in North America have been profoundly altered due to agricultural activities and urban development, with the conversion of grasslands for urban and agricultural uses proportionately exceeding that of any other habitat type (Vickery *et al* 1999; CDFG 2003). As a result, many grassland ecosystems are now considered at risk; for example, only 10% of the Central Valley's grasslands remain from the pre-European settlement period (CDFG 2003). Because of the alarming rate of conversion, many grassland–dependent wildlife species have experienced population declines (CDFG 2003). In fact, grasslands birds have declined more steeply than any other wildlife habitat guild (Vickery *et al* 1999; CDFG 2003).

Grasslands are used by a wide variety of wildlife species; the grasses and herbs provide habitat for rodents, rabbits and hares, and ground foraging and nesting birds. In turn, these species form the prey base for large predators. However, the grassland habitat values in the study area are likely moderated due to the fragmented nature of the remaining habitat patches and management activities, such as disking. Representative species include ornate shrew (*Sorex ornatus*), pocket gopher (*Thomomys bottae*), western harvest mouse (*Reithrodontomys megalottis*), California meadow vole (*Peromyscus maniculatus*), California ground squirrel (*Spermophilus beechyii*), black-tailed hare (*Lepus californicus*), American badger (*Taxidea taxus*), striped skunk (*Mephitis mephitis*), coyote (*Canis latrans*), red fox (*Vulpes fulva*), red-tailed hawk (*Buteo jamaicensis*), golden eagle (*Aquila chrysaetos*), horned lark (*Eremophila actia alpestris*), western meadowlark (*Sturnella neglecta*), savanna sparrow (*Passerculus sandwichensis*), grasshopper sparrow (*Ammodramus savannarum*) and gopher snake (*Pituophis catenifer*).

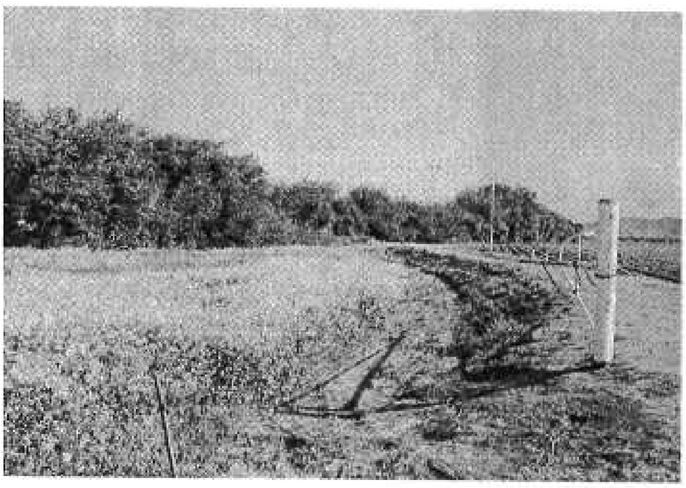

Figure 10. View of ruderal grassland plant community between agricultural road and Gabilan Creek, April 2004. This area is dominated by wild radish and poison hemlock.

3.3 Coyote Brush Scrub

The Project area supports two patches of coyote brush scrub. This scrub type occurs on slopes north and south of Natividad Creek, as depicted on Figure 2. The dominant shrub species is coyote brush (*Baccharis pilularis*). Herbaceous plant species are common between the shrubs, many of which are similar to that observed in the adjacent non-native and ruderal grasslands. Common herbaceous species in the scrub include mugwort (*Artemisia douglasiana*), ripgut brome, poison hemlock, wild mustard, poison oak (*Toxicodendron diversilobum*), and bristly ox-tongue.

3.3.1 Wildlife Resources of Coyote Brush Scrub. Due to the limited distribution of coyote brush scrub in the Project area, this plant community functions to enhance wildlife use of the larger grassland matrix by providing supplemental cover, nest and perch sites for grassland species, rather than support species typically associated with dense, broad stands of scrub. Many of the wildlife species discussed in the Grassland section, above, especially birds, are expected to utilize this resource.

3.4 Riparian Areas and Irrigation Ponds

The Project area supports reaches of Gabilan and Natividad Creeks, two perennial waterways. In addition, the project area contains several unnamed perennial and intermittent tributaries to these two creeks. The main stem and one tributary of Natividad Creek support riparian woodland. The other tributaries support herbaceous riparian vegetation, as depicted on Figure 2. Figure 3 depicts the distribution of riparian woodland along the mainstem of Gabilan Creek, which supports a willow-dominated riparian woodland. The Project area also supports several agricultural ponds. Most are off-channel irrigation ponds, however there are three in-channel ponds along the two tributaries to Natividad Creek.

3.4.1 Riparian Woodland. The mainstem of Natividad and Gabilan Creeks, as well as the easternmost tributary to Natividad Creek, are dominated by willow riparian vegetation. Typical vegetation includes arroyo willow (*Salix lasiolepis.*), shining willow (*Salix lucida)*, and blue elderberry (*Sambucus mexicana)*. There are scattered occurrences of western sycamore (*Platanus racemosa)* and coast live oak (*Quercus agrifolia)* along these drainages as well. The understory vegetation is dense with California blackberry (*Rubus ursinus)*, poison oak, and stinging nettle (*Urtica dioica)*. Adjacent to the low-flow channel of the creek are areas dominated by freshwater marsh vegetation, as discussed in Section 3.4.3.

3.4.2 Herbaceous Riparian. The Project area supports several drainage channels, many of which traverse through agricultural fields. As depicted in Figure 11, these drainages have been modified by agricultural activities (i.e., periodic clearing and/or herbicide application). Some of the drainage channels, as depicted in Figure 12 support vegetation, however, it is limited to herbaceous species within the bottom and lower edges of the channel. Tributaries to Natividad Creek were observed to support patches of willow (*Salix* sp.), however, most channels were limited to herbaceous species of watercress (*Rorrippa nasturtium-aquaticum)*, nutgrass (*Cyperus eragrostis)*, curly dock (*Rumex crispus)*, spikerush (*Eleocharis* sp.), cocklebur (*Xanthium strumarium)*, Italian ryegrass (*Lolium multiflorum)*, Bermuda grass (*Cynodon dactylon)*, rabbitsfoot grass (*Polypogon monspeliensis)* and scattered patches of California bulrush (*Scirpus californicus)* and cattail (*Typha sp.)*.

Figure 11. View of westernmost tributary to Natividad Creek, showing minimal vegetation, April 2004.

Figure 12. View of herbaceous riparian along easternmost tributary to Natividad Creek, June 2004.

3.4.2 Freshwater Marsh. Areas of freshwater marsh occur within both Gabilan and Natividad Creeks. Plant species typical of wet conditions were observed growing on sediment deposits within the creeks. Typical plant species include water smartweed (*Polygonum persicaria)*, rabbitsfoot grass, willow herb (*Epilobium ciliatum)*, watercress, curly dock, small-flowered buttercup (*Ranunculus parviflorus)*, willow dock (*Rumex salicifolius)*, swamp knotweed (*Polygonum amphibium var. emersum)*, water parsley (*Oenanthe sarmentosa)*, red-rooted cyperus (*Cyperus erthrorhizos)*, nutgrass, and small patches of cattail. The in-stream habitat type is depicted in Figure 13. Freshwater marsh vegetation also occurs along the margins of some irrigation ponds within the Project area. California bulrush was observed along the edge of several ponds. Associated species included lady's thumb (*Polygonum persicaria)*, lamb's quarter (*Chenopodium album)*, great water speedwell (*Veronica anagallis-aquatica)*, nutgrass, curly dock, willow herb, and peppergrass.

Figure 13. View of freshwater marsh within the Gabilan Creek, April 2004.

3.4.3 Wildlife Resources of Riparian Habitat . In general, wildlife values of riparian habitats are considered among the highest of all plant communities in the west, supporting a greater abundance and diversity of wildlife than any other plant community (Thomas *et al* 1979). In California, over 225 species of amphibians, reptiles, birds and mammals occur in riparian habitats (California Partners in Flight 2000). For birds, riparian habitats may also be the most important type in California, especially for nesting Neotropical migrants and as stopover sites for migrants to replenish fat reserves (Moore and Simons 1989; California Partners in Flight 2000). Healthy riparian systems provide surface water and a variety of niches for wildlife, due to the abundance of vegetation and complex habitat structure. Additionally, deciduous riparian woodlands harbor an abundance of insect prey for avian consumption, since the leaves lack compounds to protect against herbivorous insects (Kreuper 1992). The importance of riparian habitat is underscored by its limited statewide distribution, making up less than 0.5% of the total land area (California Partners in Flight 2000). For these reasons, riparian habitats are protected resources of the State.

Riparian habitat values in the study are considered low to moderate due to agriculture-related disturbances. Areas of low habitat value include the upper-half of Natividad Creek and the east tributary to Natividad Creek, where the channels have been modified into v-shaped agricultural drainages ditches and vegetation on the banks is regularly managed. Areas of moderate habitat value are typified by willow woodlands largely confined to the immediate banks along Gabilan Creek, lower Natividad Creek (below the confluence), and an unnamed tributary to Natividad Creek. Along Gabilan Creek, the riparian corridor is continuous, dense and relatively broad with mature willows. Natividad Creek supports riparian habitat only along the lower reach, just below the confluence with an unnamed tributary, where the willow riparian is discontinuous and narrow, except for a small, but broad patch at the confluence. In both cases, row crop agriculture borders the creeks. Willow riparian is also present along an unnamed drainage paralleling Old Stage Road, where it occurs in patchy, discontinuous stands with occasional eucalyptus groves in the overstory. Land uses bordering this drainage include a mix of cattle grazing, rural residential development and row crop agriculture.

Representative species of riparian habitats in the study area include Pacific treefrog (*Hyla regilla*), California red-legged frog (*Rana aurora draytonii*), bullfrog (*Rana catesbeiana*), western toad (*Bufo boreas*), southern Pacific pond turtle (*Actinemys marmorata pallida*), Allen's hummingbird (*Selasphorus sasin*), Pacific-slope flycatcher (*Empidonax difficilis*), Swainson's thrush (*Catharus ustulatus*), Wilson's warbler (*Wilsonia pusilla*), black-headed grosbeak (*Pheucticus melanocephalus*), song sparrow (*Melospiza melodia*) and muskrat (*Procyon lotor*).

3.4.5 Wildlife Resources of Irrigation Ponds. The aerial base map shows eleven agricultural irrigation ponds widely-distributed throughout the study site. However, of these, only two (Ponds 1 and 2) supported aquatic habitat during this study (Figure 4). Of the remaining ponds, two were dry and seven were no longer present (i.e. removed).

Pond 1 is located at the corner of Old Stage Road and Williams Road and is approximately 140' long and 75' wide. The pond is bermed above grade and water levels appear to be maintained through ground water pumping. Pond 2 is located near East Boronda Road, approximately 6,000' northwest of Pond 1. Pond 2 is located within an intermittent drainage and is approximately 375' long and 80' wide at full capacity. The pond is created by an artificial berm and water levels are maintained by agricultural runoff and pumping during the dry season.

Irrigation ponds can be significant sources of surface water for wildlife, supplementing naturally occurring water sources and distributing surface water over a broader area, perhaps even to those areas which would not support standing water otherwise. Irrigation ponds can be focal points of wildlife use as many species require water for drinking, bathing, reproduction and cover. Ponds are especially important for aquatic species that use them for breeding. Typical species inhabiting ponds include bullfrog, Pacific treefrog, western toad, southern Pacific pond turtle , Santa Cruz garter snake (*Thamnophis atratus*), great egret (*Ardea alba*) and mallard (*Anas platyrhynchos*). Habitat values will vary between ponds, depending on their hydrologic regime, extent of vegetation and presence of non-native predatory fishes.

3.5 Woodlands and Tree Groves

3.5.1 Oak Woodland. The Project area supports an oak grove near the intersection of Williams and Old Sage Road. The grove is comprised of large-sized, mature coast live oak trees. The understory is comprised of plant species typical of ruderal (weedy) grassland. Plant species observed within the understory include foxtail barley, ripgut brome, bur clover, common fiddleneck, bull mallow, wild oat, wild mustard, horehound (*Marrubium vulgare)*, wild radish, willow herb, poison hemlock, milk thistle (*Silybum marianum)*, prickly sow thistle, and shepard's purse. The woodland also supports scattered blue elderberry shrubs.

3.5.2 Landscape Tree Groves. There are several groves of planted landscape/residential trees located within the Project area. The majority of the trees are eucalyptus (*Eucalyptus sp.)*, Monterey pine (*Pinus radiata)*, Monterey cypress (*Cupressus macrocarpa)* and walnut (*Juglans hindsii).*

3.5.3 Wildlife Resources of Oak Woodlands. In general, oak woodlands are considered critical habitats for the conservation of many bird and mammal species (U.S. Forest Service 1999; Block *et al* 1990). Over 300 vertebrate species are known to use oak trees. Noteworthy features of oak habitats include acorns, snags and cavity-bearing trees. As a seasonal food, acorns play an important role in the survival of many species of wildlife in fall, and since a mature oak can produce thousands of acorns during a favorable year (Tietje 1990; Giusti and Tinnin 1993). Mature oak trees frequently bear snag limbs and natural cavities as a result of limb scars. Snags are important resources for such uses as nesting, roosting, foraging, caching and wintering (Davis 1983), but especially critical to primary cavity-nesters such as woodpeckers, which prefer dead trees and limbs for excavation of roost and nest sites (Thomas *et al* 1979). Snags and branches bearing natural cavities also are critical for secondary cavity-nesting birds (e.g., chickadees, titmice, nuthatches, etc.), and as den or roost sites for small mammals. Due to the inherent high wildlife value of oaks, oak habitats are protected resources of the State.

Oak woodland habitat is largely limited to an approximately 11-acre patch located near the junction of Old Stage Road and Williams Road. This stand mostly consists of large, mature live oaks, with multiple cavities and snag limbs. However, the habitat values of the oak woodland are diminished due to the fragmented and isolated nature of the stand, understory management (i.e., disking), and ground squirrel control (e.g., bait stations).

Representative cavity-nesting wildlife of the oak woodland on the site include Nuttall's woodpecker (*Picoides nuttallii*), ash-throated flycatcher (*Myiarchus cinerascens*), oak titmouse (*Baeopholus inornatus*), chestnut-backed chickadee (*Poecile rufescens*), violet-green swallow (*Tachycineta thalassina*) house wren (*Troglodytes aedon*) and western bluebird (*Sialia mexicana*). Acorns likely constitute a significant portion of the diet of California quail (*Callipepla californica*), western scrub-jay (*Aphelocoma californica*) and black-tailed deer (*Odocoileus hemionus columbarius*). Additionally, snags and cavity-bearing oaks may provide cover, roost and/or nest sites for species such as raccoon (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), dusky-footed woodrat (*Neotoma fuscipes*) and pallid bat (*Antrozous pallidus*).

3.5.4 Wildlife Resources Of Landscape Tree Groves. Where eucalyptus trees are present, they supplement existing habitats with roosting and nesting sites for a variety of birds. This resource is especially noteworthy in areas lacking trees, such as within the study area. Eucalyptus groves are scattered within the unnamed drainage paralleling Old Stage Road and occur elsewhere in the vicinity of ranch dwellings. Due to their tall heights and dense crown cover, eucalyptus trees offer excellent nesting, roosting and perching sites for raptors such as turkey vulture (*Cathartes aura*), red-tailed hawk (*Buteo jamaicensis*) and great horned owl (*Bubo virginianus*). A variety of woodland songbirds, including pacific-slope flycatcher (*Empidonax difficilis*), Cassin's kingbird (*Tyrannus vociferans*), western kingbird (*T. verticalis*), chestnut-backed chickadee (*Poecile rufescens*), Bullock's oriole (*Icterus bullockii*), Brewer's blackbird (*Euphagus cyanocephalus*), purple finch (*Carpodacus purpureus*), house finch (*C. mexicana*) and Lawrence's goldfinch(*Carduelis lawrencei*) nest in eucalyptus groves. Flowering trees also provide important nectar sources for Anna's hummingbird (*Calypte anna*) and Allen's hummingbird (*Selasphorus sasin*). Bird species abundance and diversity is probably highest during fall and in winter, when migrants and wintering birds, such as cedar waxwings (*Bombycilla cedrorum*), yellow-rumped warbler (*Dendroica coronata*), Townsend's warbler (*D. townsendii*) and orange-crowned warbler (*Vermivora celata*) supplement the resident population.

4.0 SENSITIVE BIOTIC RESOURCES

4.1 Sensitive Habitats

Sensitive habitats are defined by local, state, or federal agencies as those habitats that support special status species, provide important habitat values for wildlife, represent areas of unusual or regionally restricted habitat types, and/or provide high biological diversity. Within the Project area, the riparian, wet meadow, freshwater marsh and native grassland habitats are considered rare by CNDDB (CNDDB, May 2002). Although a formal delineation of wetlands was not conducted as part of this study, the herbaceous riparian, freshwater marsh and wet meadow areas may meet the definition of wetlands under U.S. Army Corps of Engineers criteria. This is due to the observed dominance of wetland plant species and the corresponding topography that suggests sufficient seasonal ponding and/or surface soil saturation during the growing season to provide hydric conditions.

4.2 Special-Status Plant Species

Plant species of concern include those listed by either the federal or state resource agencies as well as those identified as rare by CNPS. A list of such plant species with the potential to occur in the Project area is presented on Table 2, List of Special-Status Plant Species Evaluated as to their Potential to Occur in the Vicinity of the Project Area. Of the 26 plant species evaluated for presence within the Project area, only one species, Congdon's tarplant, was observed. The Project area does, however, provide suitable habitat for three other species, yet none of these species were observed during surveys in spring or summer 2004, as listed on Table 2.

4.2.1 Congdon's Tarplant (*Centromadia parryi ssp. congdonii*). This species is recognized as rare by the California Native Plant Society (List 1B). The species is also considered rare by the California Department of Fish and Game (CDFG), however the species is not currently listed as endangered or threatened under the California Endangered Species Act. The species is considered a Species of Concern by the U.S. Fish and Wildlife Service, however it is not currently listed as endangered or threatened under the Endangered Species Act.

This species is known from the greater Monterey Bay region, with several occurrences recorded from the Salinas area. The occurrence of this species in the Project area has been previously recorded in the CNDDB as occurrence #7. In 1998, the species was reported to inhabit 586 acres of annual grassland east of Old Stage Road, supporting approximately 214,000 plants (CNDDB, 2004). Occurrences in the close vicinity of the Project area include a colony west of the Project area along Natividad Creek (occurrence #58, 88 plants in 2002), occurrence #36, located along Old Stage Road north of Natividad Road, and occurrence #37 along Old Stage Road, southeast of Zabala Road. Congdon's tarplant grows in annual grasslands, typically in areas with high seasonal moisture. The blooming period is typically from June to October.

In 2004, the Salinas Annexation Project area supported approximately 2.1 acres of occupied Congdon's tarplant in three patches; this distribution is depicted on Figure 2. This area of occupied habitat was based on the presence of aboveground plants. Approximately 2,000 individuals were observed in these three patches, based on field observations in June 2004. In 1998, the species was reported from 586 acres, supporting approximately 214,000 plants (CNDDB, 2004). As Congdon's tarplant is an annual species its population can vary from year to year, depending upon weather conditions (e.g., rainfall, temperature) as well as human and natural disturbances within the species habitat. In 2004, the population supported significantly fewer plants than observed in 1998. Seeds are expected to persist in the soil seedbank and may germinate under more favorable conditions. The species and its habitat, as observed in 2004, is depicted in Figure 14. The distribution of the species, based upon the observation of aboveground plants, is depicted on Figure 2.

Table 2. List of Special Status Plant Species Evaluated as to their Potential to Occur in the Vicinity of the Project Area

Species	CNPS	State Status	Federal Status	Habitat Type	Occurrence in Vicinity by CNDDB? Likely Occurrence on Site?
Hickman's Onion (*Allium hickmanii*)	List 1B	None	None	Closed cone coniferous forests, chaparral, coastal bluff scrub	Recorded from south of Marina (Ft. Ord) Project area does not provide suitable habitat, species was not observed in spring 2004.
Monterey manzanita (*Arctostaphylos montereyensis*)	List 1B	None	None	Chaparral, coastal scrub	Recorded from Ft. Ord Project area does not provide suitable habitat, species was not observed in spring 2004.
Hooker's manzanita (*Arctostaphylos hookeri ssp. hookeri*)	List 1B	None	None	Closed-cone coniferous forest, maritime chaparral, coastal scrub	Recorded from Ft. Ord Project area does not provide suitable habitat, species was not observed in spring 2004.
Dune manzanita (*Arctostaphylos montereyensis*)	List 1B	None	None	Closed-cone coniferous forest, maritime chaparral, coastal scrub, coastal dunes	Recorded from Ft. Ord, near Marina, Toro Regional Park Project area does not provide suitable habitat, species was not observed in spring 2004.
Pajaro manzanita (*Arctostaphylos pajaroensis*)	List 1B	None	None	Closed-cone coniferous forest, maritime chaparral, coastal scrub, coastal dunes	Recorded from Prunedale Area Project area does not provide suitable habitat, species was not observed in spring 2004.
Alkali milk-vetch (*Astragalus tener var. tener*)	List 1B	None	None	Alkali wetlands	Historic occurrence 1 mile northeast of Salinas; other occurrences from Hollister (San Benito County); herbarium collections from 1889 Suitable habitat potentially present; however species not observed in spring 2004.
San Joaquin saltbush (*Atriplex joaquiniana*)	List 1B	None	None	Coastal scrub; riparian scrub	Recorded from Hollister area Project area does not provide suitable habitat, species was not observed in spring 2004.
Congdon's tarplant (*Centromadia parryi ssp. congdonii*)	List 1B	None	None	Seasonal wetlands in annual grasslands	Recorded from Project area, east of Old Stage Road and other areas in greater project vicinity. Observed within Project area in early summer 2004; approximately 2,000 individuals.
Monterey spineflower (*Chorizanthe pungens var. pungens*)	List 1B	None	Threatened	Coastal dunes, chaparral, coastal scrub (in loose sandy soils)	Recorded from Ft. Ord, Marina and Seaside Areas Project area does not provide suitable habitat, species was not observed in spring 2004.
Robust spineflower (*Chorizanthe robusta var. robusta*)	List 1B	None	Endangered	Cismontane woodland, coastal dunes, coastal scrub	Recorded from Salinas Valley, west of Spreckels, Marina and Ft. Ord Project area does not provide suitable habitat, species was not observed in spring 2004

Table 2. List of Special Status Plant Species Evaluated as to their Potential to Occur in the Vicinity of the Project Area

Species	CNPS	State Status	Federal Status	Habitat Type	Occurrence in Vicinity by CNDDB? Likely Occurrence on Site?
					spring 2004.
Jolon clarkia *(Clarkia jolonensis)*	List 1B	None	None	Cismontane woodland, coastal dunes, coastal scrub	Historic records (1912 and 1928) from Del Monte, Seaside area Project area does not provide suitable habitat, species was not observed in spring 2004.
Seaside bird's beak *(Cordylanthus rigidus littoralis)*	List 1B	Endangered	None	Closed cone coniferous forest, chaparral, cismontane woodland, coastal scrub/dunes	Recorded from sand hills of Seaside at Ft. Ord Project area does not provide suitable habitat, species was not observed in spring 2004.
Hutchinson's larkspur *(Delphinium hutchinsoniae)*	List 1B	None	None	Cismontane woodland, coastal scrub	Recorded from Spreckels area Project area does not provide suitable habitat, species was not observed in spring 2004.
Eastwoods ericameria *(Ericameria fasciculate)*	List 1B	None	None	Closed-cone coniferous forest, maritime chaparral, coastal scrub, coastal dunes	Recorded from Seaside, Ft. Ord, Marina and Carmel Valley areas Project area does not provide suitable habitat, species was not observed in spring 2004.
Coast wallflower *(Erysimum ammophilum)*	List 1B	None	Species of Concern	Maritime chaparral, coastal dunes, coastal scrub	Recorded from south of Ft. Ord, south of Marina along Highway 1 and E of Reservation Road, Marina State Beach Project area does not provide suitable habitat, species was not observed in spring 2004.
Yadon's wallflower *(Erysimum menziesii ssp. yadonii)*	List 1B	Endangered	Endangered	Coastal dunes	Recorded from dunes west of Marina, S of Salinas River, W of Lapis Siding Project area does not provide suitable habitat, species was not observed in spring 2004.
Fragrant fritillary *(Fritillaria liliacea)*	List 1B	None	None	Grasslands	Recorded from south of Aromas Suitable habitat potentially present; however species not observed in spring 2004.
Sand gilia *(Gilia tenuiflora ssp. arenaria)*	List 1B	Threatened	Endangered	Coastal dunes, coastal scrub, maritime chaparral	Recorded from Marina State Beach, Ft. Ord, E of Del Monte and Reservation Rd., NW of Hwy 1and Reservation Rd., Project area does not provide suitable habitat, species was not observed in spring 2004.
Santa Cruz tarplant *(Holocarpha macradenia)*	List 1B	Endangered	Threatened	Grassland	Known form northern Monterey County, off Elkhorn Road Suitable habitat within Project area; however species not observed in spring or summer 2004.
Kellogg's horkelia *(Horkelia cuneata ssp.*	List 1B	None	Species of Concern	Closed cone coniferous forests, chaparral, coastal scrub, old	Recorded from 1 mi. N of Marina (1940) and Ft. Ord S of Marina

Species	CNPS	State Status	Federal Status	Habitat Type	Occurrence in Vicinity by CNDDB? Likely Occurrence on Site?
sericea)			Concern	dunes	Suitable habitat within Project area; however species not observed in spring or summer 2004.
Contra Costa goldfields *(Lasthenia conjugens)*	List 1B	None	Endangered	Mesic grassland	Known form Ft. Ord, southwest of Salinas Suitable habitat within Project area; however species not observed in spring or summer 2004.
Marsh microseris *(Microseris paludosa)*	List 1B	None	None	Mesic grassland	Historic occurrences from Seaside area Suitable habitat within Project area; however species not observed in spring or summer 2004.
Yadon's rein orchid *(Piperia yadonii)*	List 1B	None	Endangered	Closed cone coniferous forests, chaparral, coastal bluff scrub	Recorded from south of Marina (Ft. Ord), Marina, Prunedale Project area does not provide suitable habitat, species was not observed in spring 2004.
Santa Cruz clover *(Trifolium buckwestiorum)*	List 1B	None	None	Mesic grassland	Recorded from Laguna Seca, Tarpy Flats and Ft. Ord Suitable habitat within Project area; however species not observed in spring or summer 2004.
Saline clover *(Trifolium depauperatum var. hydrophylum)*	List 1B	None	None	Alkali wetlands	Historic occurrence near Moss Landing; other occurrences from Soda Lake (Santa Cruz County) and Hwy 25 (San Benito County) Suitable habitat within Project area; however species not observed in spring 2004.
Pacific Grove clover *(Trifolium polyodon)*	List 1B	Rare	None	Mesic grassland	Recorded from Carmel Valley area Suitable habitat within Project area; however species not observed in spring 2004.

<u>CNPS Status:</u>

List 1B: These plants (predominately endemic) are rare through their range and are currently vulnerable or have a high potential for vulnerability due to limited or threatened habitat, few individuals per population, or a limited number of populations. List 1B plants meet the definitions of Section 1901, Chapter 10 of the CDFG Code. **List 4:** Plants of limited distribution; a watch list.

Figure 14. Congdon's tarplant (*Centromadia parryii ssp. congdonii*) growing within slight depression in Project area, June 17, 2004.

4.3 Special-Status Wildlife Species

In the context of this study, special-status species include animals with State or Federal endangered or threatened status, Federal and State proposed or candidate species for listing, State "fully protected" species and California species of special concern. Thirteen special-status species have been recorded or may occur within the boundaries of the study area; these include California tiger salamander, California red-legged frog, southern Pacific pond turtle, white-tailed kite (*Elanus leucurus*), northern harrier (*Circus cyaneus*), Cooper's hawk (*Accipiter cooperii*), burrowing owl (*Athene cunicularia*), California horned lark (*Eremophila alpestris actia*), loggerhead shrike (*Lanius ludovicianus*), yellow warbler (*Dendroica petechia*), tricolored blackbird (*Agelaius tricolor*), pallid bat and Monterey dusky-footed woodrat (*Neotoma fuscipes luciana*) (see Table 3). For these species, the study area provides known or potential breeding habitat or significant wintering habitat. A description of the status, natural history and pattern of occurrence for these species is presented below.

Several other special-status species were also considered, but are not discussed in further detail for one or more of the following reasons: 1) the species is believed to be extirpated from the area; 2) the species is expected to occur on the study site only as a transient; 3) wintering individuals may be present, however, only the breeding population of the species is protected and the study site does not provide nesting habitat; 4) lack of suitable habitat in study area; and 5) the study area is outside of the species' known distributional range. These species include western spadefoot toad (*Spea hammondii*), California legless lizard (*Anniella pulchra*), California horned lizard (*Phrynosoma coronatum frontale*), San Joaquin coachwhip (*Masticophis flagellum ruddockii*), two-striped garter snake (*Thamnophis hammondii*), golden eagle, ferruginous hawk (*Buteo regalis*), prairie falcon (*Falco mexicana*), merlin (*F. columbarius*), short-eared owl (*Asio flammeus*), willow flycatcher (*Empidonax traillii*), least Bell's vireo (*Vireo belli pusillus*), yellow-breasted chat (*Icteria virens*) and San Joaquin pocket mouse (*Perognathus inornatus psammophilus*).

Table 3. Special Status Wildlife Species, Salinas Annexation Project Area.

Species	Status	Occurrence on Site
California Tiger Salamander	FT, CSC	Population on-site is hybrid. Breeding habitat in irrigation ponds Nos. 1 and 2. Potential upland habitat on remnant grasslands and oak woodlands. May also use burrows along dirt access roads in vicinity of breeding ponds. One tiger salamander recorded on Old Stage Road during winter 2002 (separate study).
California Red-legged Frog	FT, CSC	Adults and tadpoles observed along unnamed drainage paralleling Old Stage Road, and 1 adult observed in culvert pool at upper-end of east tributary. Red-legged frogs also observed on Old Stage Road during studies in 2002-03. Potential habitat along Gabilan Creek. All drainages could provide CRF habitat at some level.
Southern Pacific Pond Turtle	CSC	One pond turtle observed in the unnamed drainage and in Natividad Creek. One road-kill observed on E. Boronda Road, adjacent to study area. Also, in 2002-03, dozens observed in two ponds on Culina property, prior to the removal of the ponds. Depending on the hydrologic regime, irrigation ponds and all drainages on-site provide potential habitat. May nest in grasslands and agricultural fields.
White-tailed Kite	FP	Kites observed foraging over fields during this study as well as in 2002-03. Potential nesting habitat in riparian woodlands and eucalyptus groves.
Northern Harrier	CSC	Harriers observed in 2002. Grasslands and ruderal uplands provide potential foraging and nesting habitat. Nesting habitat may be marginal, due to agricultural practices and fragmentation.
Cooper's Hawk	CSC	Female observed displaying nest defense behavior in riparian corridor on Wayland parcel. Nesting pair observed just west of the study site in Natividad Creek.
Burrowing Owl	CSC	Grasslands and ruderal uplands with ground squirrel burrows provide potential denning habitat. No nesting owls observed on-site during 2004 surveys. One burrow with owl pellet observed on Andrus parcel; perhaps from a wintering or migrant owl.
California Horned Lark	CSC	Singing males and pairs observed throughout the study site; likely nests on bare disced areas, fallow fields, between row crops and in grazed grasslands. Family groups observed in 2002- 03.
Loggerhead Shrike	CSC	No nesting shrikes observed on-site, during this study or during 2002-03. However, this species is known to nest in the project region and may nest on-site in future years. One shrike was observed on 2 Nov. Potential nesting habitat in grasslands with scattered trees and shrubs.
Yellow Warbler	CSC	Potential nesting habitat in willow riparian along Gabilan Creek, Natividad Creek and the unnamed drainage; singing males observed during the breeding season during 2002-03 and in 2004.
Tricolored Blackbird	CSC	Grasslands provide foraging habitat. Nesting colony observed at an irrigation pond just south of the study area. Potential nesting habitat on-site in the dense tule stand on the Wayland parcel.
Monterey Dusky-footed Woodrat	CSC	The remnant oak woodland and riparian corridors may provide potential habitat. Habitats may be marginal due to fragmentation and ground squirrel control in adjacent agricultural areas.
Pallid Bat	CSC	Farm structures and large, mature oaks may provide roosting habitat.

Status Codes: FT = Federally Threatened; CSC = California Species of Special Concern; FP = State Fully Protected.

4.3.1 California Tiger Salamander. The California tiger salamander is a Federal threatened species and State species of special concern (USFWS 2004; CDFG 2004b). The population consists of three Distinct Population Segments (DPS) – the Santa Rosa DPS, Santa Barbara DPS and Central California DPS, all of which are Federally listed as threatened or endangered (USFWS 2004; USFWS 2003). The California tiger salamander (CTS) has disappeared from 55% of its historic range (Jennings and Hayes 1994). Presently, this species is distributed in the Central Valley from Yolo County south to Tulare County, and in the Coast Range valleys and lower foothills from Sonoma County south to Santa Barbara County (Shaffer 1991). California tiger salamanders primarily inhabit valley floor and foothill grasslands, open oak woodlands and scrub habitats encompassing vernal pools and seasonal ponds (Trenham 2001a; USFWS 2000). Post-metamorphic individuals (i.e., adults and juveniles) live in rodent burrows in uplands for most of their lives (Trenham 2001; Trenham *et al* 2000; Loredo *et al* 1996). During the rainy season, typically November through March, adults migrate at night to aquatic breeding sites (Loredo and Van Vuren 1996; Stebbins 1985), which include quiet waters of seasonal ponds, reservoirs, lakes and occasionally stream pools (Stebbins 1985). Tiger salamanders have osmoregulatory adaptations that allow for existence in highly alkaline aquatic environments (Kirschner et al. 1971; Romspert and McClanahan 1981). Based on a recent study, migration distances of adults between upland habitat and breeding pools generally are within 450 m (Trenham and Shaffer *in prep.*), but distances up to 2 km (1.2 miles) have been recorded (USFWS 2000). In habitats encompassing several ponds, experienced adults may breed at more than one pond during their lifetime (Trenham *et al* 2001). The adults remain at the breeding pond from one day to several weeks, then return to upland refugia (Loredo and Van Vuren 1996). Males migrate to breeding sites before females and tend to stay at breeding sites longer (e.g., 6 – 8 weeks for males and 1 – 2 weeks for females)(Trenham *et al* 2000; Loredo and Van Vuren 1996; Shaffer 1993). Eggs are laid singly, or in small groups of up to four, on stalks of submerged vegetation or other objects (e.g., rocks woody material, etc.), typically along the shoreline. The eggs hatch in 10 days to approximately three weeks (USFWS 2000; Jennings and Hayes 1994; Storer 1925). The number of eggs deposited per female per breeding season ranges from around 400 – 1,300 (USFWS 2000). The diet of larvae consists of aquatic insects and other invertebrates, and mostly tadpoles as the larvae grow larger (USFWS 2000; Petranka 1998; Anderson 1968). Larvae typically metamorphose in two to three months, from late spring to summer, when ponds begin to dry (USFWS 2000). Metamorphs emerge from ponds and seek shelter mostly in the immediate vicinity in burrows, cracks in the ground or under debris, but sometimes as far as 200m away, even in the absence of rain (Trenham 2001b; Trenham and Shaffer *in prep.*; Loredo *et al* 1996). During the rainy-season, the juveniles continue to disperse farther to seek refuge in upland areas within 640 m of the breeding pond, but distances up to 1.6 km away from the breeding pond have been recorded (Jennings and Hayes 1994). Adults live up to at least 10 years, but take up to 4 – 5 years to reach sexual maturity (Trenham *et al* 2000). Females may not breed every year and only may breed once or twice during their lifetime (Trenham *et al* 2000). Sub-adults and adults appear to be "sit-and-wait" predators, preying on earthworms, insects and snails (CDFG 1990; Lindquist and Bachmann 1980). Threats and reasons for the decline of this species include loss of breeding and upland habitat and habitat fragmentation due to agricultural and urban development; the introduction of bullfrogs (*Rana catesbeiana*)and predatory non-native fishes; use of larval forms as fishing bait; and hybridization with introduced non-native tiger salamanders (USFWS 2000; Stebbins 2003; Stebbins 1985).

4.3.1.1 Local Occurrence. The CNDDB lists several records of *Ambystoma tigrinum* spp. in the relevant project region, including contemporary records of specimens found north of Salinas near Harrison Road, Herbert Road and San Juan Grade, and an historic record (1952) for the City of Salinas (CNDDB 2004). In addition to the CNDDB records, additional observations were identified through consultations with other biologists. These include one hybrid/non-native population east of Natividad (B. Fitzpatrick, pers. comm.); one hybrid/non-native population east of the project site (B. Fitzpatrick, pers. comm.); one hybrid/non-native population near Spence Road (B. Fitzpatrick, pers. comm.); and one possible hybrid/non-native population near Harrison Rd. (M. Allaback, pers. comm.). Table 4 summarizes the location of *Ambystoma* observations discussed, above.

Table 4. Tiger Salamander Observations in the Project Site Vicinity.

Taxon	Location	Distance from Project Site	Source
Ambystoma sp.	Old Stage Rd	~ 50 ft.	CNDDB 2004
Hybrid/Non-native	Pond east of project site	~ 1,563 ft.	B. Fitzpatrick, pers. comm.
Hybrid/Non-native	Pond east of Natividad	~ 1.1 mi.	B. Fitzpatrick, pers. comm.
Ambystoma sp.	Pond near Harrison Rd	~ 2.0 mi.	M. Allaback, pers. comm.
Ambystoma sp.	Pond near Harrison Rd	~ 2.0 mi.	CNDDB 2004
Ambystoma sp.	Pond at end of Herbert Rd	~ 3.4 mi.	CNDDB 2004
Hybrid/Non-native	Pond at Spence Rd	~ 4.9 mi.	B. Fitzpatrick, pers. comm.
Ambystoma californiense	Pond near San Juan Grade	~ 5.3 mi.	CNDDB 2004
Ambystoma *sp.*	West of Salinas	?	CNDDB 1952 record

4.3.1.2 Site Assessment. Non-native and CTS hybrids were discovered in the study area at Ponds No. 1 and 2 (Figure 4), during spring larval surveys, based on DNA analysis of tissue samples collected from the site performed by Ben Fitzpatrick, Center of Conservation Biology, UC Davis (letter dated 9/2/04) Furthermore, DNA analysis suggests that there is a very low likelihood that native CTS are still present in the hybrid populations (B. Fitzpatrick, pers. comm.). No *Ambystoma* larvae were observed in the unnamed drainage paralleling Old Stage Road. Their absence in the drainage is consistent with negative results from spring surveys performed in 2002-03 along Natividad Creek and its tributaries for a separate study (Bryan Mori Biological Consulting Services Biotic Resources Group 2003). During that study, an adult road-kill tiger salamander also was observed on Old Stage Road, during the fall of 2002.

Although breeding habitat for hybrid/non-native tiger salamanders has been confirmed at Ponds 1 and 2 during this study, upland habitat use has not been documented. Considering the long-distance dispersal capabilities of this species, the remnant stands of grassland, ruderal and oak woodland within 2,000 feet of Ponds 1 and 2 likely provide upland habitat for adults and sub-adults (Trenham and Shaffer *in prep.*). Another factor to consider is the movement of tiger salamanders onto the project site from the foothills east of Old Stage Road. The presence of hybrid/non-native tiger salamander breeding ponds on the project site together with the observation of a road-kill on Old Stage Road in 2002 and the presence of a hybrid/non-native breeding pond to the east suggest that salamanders likely move between the foothills to the east of Old Stage Road and the study site, especially since potential breeding habitat in the foothills to the east (i.e., three reservoirs/ponds) are within dispersal distance to the study site.

Hybrids and non-native tiger salamanders are considered serious threats to the integrity of native CTS populations, since "hybridization can lead to the loss of the native taxon through genetic assimilation" (USFWS 2004). Hybridization is widespread in the Central Coast region, extending from southern Santa Clara County to Fort Hunter Liggett in Monterey County, and eastward through all of San Benito County (USFWS 2004). Native populations within 2.1km (1.3mi) of hybrid populations are vulnerable to genetic assimilation (USFWS 2004). Presently, hybrid CTS populations are evaluated on a case-by-case basis, regarding protection under the Endangered Species Act (B. McIver and J. Niceswanger, pers. comm.).

For this specific project site, the USFWS does not recommend the protection of the on-site population of tiger salamanders, due to the low likelihood of native CTS present on the project site, the lack of known native CTS population sources in the relevant project vicinity, and the widespread distribution of hybrids/non-natives in the project region (J. Niceswanger, USFWS, pers. comm.).

4.3.2 California Red-legged Frog. The California red-legged frog is a Federal threatened species and a State species of special concern (USFWS 2002; CDFG 2004b). Historically, the range of this species extended southward from Marin County, coastally, and Shasta County, inland, south to Baja California (Jennings and Hayes 1994). The red-legged frog has been extirpated from 70% of its former range (USFWS 1996). Presently, red-legged frogs are found primarily in central coastal California in natural and artificial ponds, quiet pools along streams and in coastal marshes (USFWS 1996). Red-legged frogs mostly inhabit pools greater than 2 feet deep for breeding, although shallow, perennial marsh habitat may also be productive if it is free of non-native aquatic predators (Hayes and Jennings 1988; B. Mori, pers. obs.). Optimal aquatic habitat is characterized by dense emergent or shoreline vegetation for cover. However, seasonal ponds with little emergent/shoreline cover located in grasslands may also be used for breeding, where water levels permit the metamorphosis of larvae (USFWS 2002; B. Mori, pers. obs.). Breeding typically occurs between December and April, depending on annual environmental conditions and locality. Egg masses containing 2,000 – 5,000 eggs are usually deposited near the water surface on emergent vegetation but occasionally on the pond bottom where braces are absent (M. Allaback, pers. comm.). Eggs require 6 to14 days to hatch and metamorphosis generally occurs within 3.5 to 7 months after hatching, although larvae have the ability to over-winter at some sites (Fellers *et al* 2001). Following metamorphosis, generally between July and September, juveniles are 25-35 mm in size and probably do not travel far from aquatic habitats if appropriate cover is present nearby. Dispersal of juveniles generally begins with the first rains of the weather-year, although all size classes will move in response to receding water (M. Allaback, pers. obs.). Radio-telemetry data indicates that adults engage in straight-line movements irrespective of riparian corridors or topography, and they may move up to two miles between non-breeding and breeding sites (Bulger 2003). They may take refuge in small mammal burrows, leaf litter or other moist areas during periods of inactivity or whenever it is necessary to avoid desiccation (Rathbun, *et al.* 1993; Jennings and Hayes 1994; pers. obs.). Red-legged frogs emerge to forage soon after dark, and often move up to 300 feet into surrounding uplands, especially following rains, when individuals may spend days or weeks in upland habitats (Bulger 2003). Much of this species' habitat has undergone significant alteration by agricultural, urban development and water projects, leading to the extirpation of many populations (USFWS 1996). Other factors contributing to the decline of red-legged frogs include its historical exploitation as food; competition and predation by bullfrogs (*Rana catesbeiana*) and introduced predatory fishes (Jennings and Hayes 1985; Hayes and Jennings 1988; Lawler *et al* 1999); and salinization of coastal breeding habitat (Jennings and Hayes 1990).

4.3.2.1 Local Occurrence. As part of a separate study in 2002-03, red-legged frogs were documented on the study site and on Old Stage Road, immediately adjacent to the study site (Bryan Mori Biological Consulting Services and Biotic Resources Group 2003). One sub-adult was observed on Old Stage Road on 9 December 2002; one road-kill adult was observed in the same vicinity on 12 February 2003; and one adult was observed on-site in a pool, at the uppermost end of the east tributary of Natividad Creek, below the culverts at Old Stage Road

(Figure 4). In addition, the CNDDB indicates that adults were seen on the study site in October 2003 (CDFG 2004a). Other records within 5 miles of the study site include two breeding sites north of Salinas, one near Blackie Road and the other off of Pesante Canyon Road (CDFG 2004a), and an observation of adults in Gabilan Creek, near San Juan Road, north of Salinas (D. Pereksta, pers. comm.).

4.3.2.2 Site Assessment. During this study, CRF were observed on the study site on 12 and 27 May 2004, during general reconnaissance surveys and focused surveys for CTS larvae. The 12 May observation was of an adult and tadpoles at separate locations in the unnamed drainage paralleling Old Stage Road (Figure 4), whereas the 27 May observation was of a single adult at a culvert pool, at the uppermost end of the east tributary to Natividad Creek (Figure 4). The observation of tadpoles is significant, as the location represents a CRF breeding site; confirmed breeding sites are lacking in the immediate vicinity of Salinas.

Based on the results of the 2002-03 study together with this study, CRF breeding habitat is present in the unnamed drainage paralleling Old Stage Road, but appears to be absent from Natividad Creek and the east tributary, due to the degraded habitat conditions along the drainages resulting from vegetation removal and adjacent agricultural operations. In contrast, the breeding site is located within a densely vegetated drainage corridor with adjacent annual grassland habitat. The habitat quality of Gabilan Creek could not be assessed, due to restricted access. However, *all* drainages within the study site likely support CRF during one or more life stages (e.g., breeding, over-summering, dispersal), depending on the hydrologic characteristics, presence of predators, extent of vegetation and adjacent upland uses. Although no CRF were observed at Ponds No. 1 and 2, focused surveys for this species were not performed. As is the case for the drainages within the study site, the irrigation ponds also may support CRF during dispersal or over-summering, and perhaps breeding during optimal conditions. Another factor to consider is movement on- and off-site. The observations of CRF on Old Stage Road during the winter of 2002-03 suggest that they may move to and from the site, perhaps dispersing from breeding habitat located in the foothills to the east of the study site.

4.3.3 Southern Pacific Pond Turtle. The southern Pacific pond turtle is a State species of special concern (CDFG 2004b). The western pond turtle has been separated into two subspecies *Actinemys m. marmorata* is the northern subspecies and *Actinemys m. pallida* is the southern subspecies. Current research suggests, however, that the taxon may be represented by three distinct populations in California and may therefore require a taxonomic revision (Jennings and Hayes 1994). In California, the pond turtle is distributed mostly along the Pacific slope drainages from Oregon to Mexico (Jennings and Hayes 1994). Pond turtles primarily occur in permanent freshwater ponds, lakes, marshes and quiet waters of streams (Bury and Holland 1993). Pond turtles favor sites with the largest and deepest pools and with an abundance of basking sites, such as partially submerged logs or rocks, matted emergent vegetation, or exposed shorelines (Bury and Holland 1993); pond turtles displace one another from basking sites, where such resources are limited (Bury and Wolfheim 1973). Pond turtles are highly sensitive and will seek cover when approached within 100 meters (Bury and Holland 1993). Undercut banks, root masses and boulder piles provide underwater escape cover (Bury and Holland 1993). Although highly aquatic, pond turtles leave the water to reproduce, aestivate and overwinter (Jennings and Hayes 1994). Females dig nests and deposit eggs, during May and June, along the shoreline or in a variety of open upland habitats, usually within 200 meters of water, but as much as 500 meters, and mostly on south-facing slopes with well-drained clay soils (Rathbun *et al* 1992; Jennings and Hayes 1994). Nests must remain dry for proper incubation, and the young hatch and may overwinter in the nest (Jennings and Hayes 1994). Hatchlings require shallow water habitat with dense emergent vegetation and abundant zooplankton (Jennings and Hayes 1994). Pond turtles reach sexual maturity between seven and fourteen years of age (Bury and Holland 1993) and live to be over 42 years (Jennings and Hayes 1994). During dispersal, pond turtles can move up to two kilometers in search of suitable habitat and can tolerate a minimum of seven days without water (Jennings and Hayes 1994). Studies on central coast drainages show that turtles use upland habitat within 50 meters of the creek in times of drought or to avoid winter floods (Rathbun *et al* 2002). Pond turtles are threatened by habitat alteration and loss due to water development, agricultural practices and non-native predators (Jennings and Hayes 1994).

4.3.3.1 Local Occurrence. Except for one record which references the 2002 observation cited below, no other pond turtle records were listed in the regional CNDDB Quads.

4.3.3.2 Site Assessment. During a separate study, western pond turtles were observed on the study site in 2002 at two irrigation ponds on the Cuhna property, adjacent to Natividad Creek (Bryan Mori Biological Consulting Services and Biotic Resources Group 2003). Twelve turtles between 4-8" carapace length were observed at the ponds, the differing size classes suggesting the turtle population consisted of breeding individuals. These ponds no longer exist as the landowner removed them sometime in late 2002 (V. DiMaggio, Creekbridge Homes, pers. comm.).

During this study, three pond turtles were observed, two of which were on-site and one immediately adjacent to the study site. The on-site observations were one ≈6" carapace-length turtle in the unnamed drainage on 19 April and one ≈5" carapace length turtle in Natividad Creek on 27 May. The off-site observation was a road-kill turtle (≈8" carapace length)on E. Boronda Road on 19 May (Figure 4). However, it is not certain to what extent the site is being utilized, as focused surveys for this species were not performed. Although no pond turtles were observed at Ponds 1 and 2, they are considered potential habitat, along with all other drainages on the study site. The location of the road-kill on E. Boronda Road suggests that the turtle may have originated from Pond 2. Ponds and drainages in the study area may serve as dispersal, over-summering or permanent habitat, depending on hydrological characteristics. Bare areas and ruderal and agricultural fields adjacent to aquatic habitat likely provide nesting habitat.

4.3.4 White-tailed Kite. The white-tailed kite is designated a State "fully protected" species (CDFG 2004b). Once considered extirpated throughout much of California in the early 1900s (Faanes and Howard 1987) due to habitat loss and indiscriminate shootings (Palmer 1988), kite populations have increased significantly since the 1960s (Faanes and Howard 1987; Palmer 1988). Presently, kites are distributed throughout the coastal foothills and valleys along the entire length of the state, throughout the Central Valley, and into the foothills of the Sierra Nevada (Dunk 1995). White-tailed kites inhabit grassland, oak savannah, agricultural and wetlands habitats, as well as riparian corridors adjacent to open fields (CDFG 1990; Dunk 1995). Kites nest in isolated trees or trees located in dense stands near foraging habitat (Palmer 1988; Dunk 1995). Small mammals, especially voles, constitute a major portion of their diet (CDFG 1990; Dunk 1995). In fact, the increase in California vole (*Microtus californicus*) populations resulting from agricultural development has contributed to this species' comeback in California (Faanes and Howard 1987; Palmer 1988). They generally hunt at the beginning and end of each day during the breeding season, with increased effort throughout the day in winter (Dunk 1995). Kites hunt almost exclusively by hovering (Dunk 1995). Kites are considered moderately social, as territory sizes are typically small; but territory size is dependent on food availability and competition, and territory defense is exhibited year-round (Dunk 1995). Kites are monogamous with pair bonds maintained throughout the year (Dunk 1995). Nests are built in the upper third of trees with tree heights ranging from three to five meters (Dunk 1995). Nests are generally not reused (Dunk 1995). The nesting season is protracted and generally spans February to August, with up to two broods produced in a season, even if the first nesting is successful (Palmer 1988; Dunk 1995). Incubation lasts 30 - 32 days with fledging occurring four to five weeks after hatching (Dunk 1995). During winter, kites usually spend the night at communal roosts that may support >100 kites (Dunk 1995). Although the California population of kites dramatically increased from the 1930s to the 1970s, recent Breeding Bird Surveys from the 1980s to 1990s suggest a declining trend. The decline may be due to a combination of factors such as habitat conversion of grasslands and agricultural fields to urban development, and long-term drought (Dunk 1995).

4.3.4.1 Local Occurrence. In Monterey County, white-tailed kites are uncommon permanent residents in open habitats bordered by riparian woodlands (Roberson 2002). Probable nesting evidence by kites has been recorded in the project area (Roberson and Tenney 1993). No records for this species in the project vicinity were found in the regional CNDDB quads. The local breeding season spans March through July.

4.3.4.2 Site Assessment. During the course of this study, white-tailed kites were observed on-site on 20 April and 24 May 2004, foraging over agricultural fields and grassland patches in the vicinity of Natividad Creek. No evidence of nesting was observed, however focused surveys for this species were not performed and their nesting status on-site remains uncertain. The eucalyptus groves and riparian woodlands on the study site provide potential nesting habitat. The grasslands and fallow fields offer foraging habitat for kites.

4.4.5 Northern Harrier. The northern harrier is a State species of special concern (breeding population) (CDFG 2004b). Harriers are permanent residents in the Central Valley and bordering foothills, the northeastern plateau, and in coastal valleys and foothills along the length of the state (CDFG 1990). In winter, harriers are distributed widely throughout the state in suitable habitat (CDFG 1990). During the breeding period, harriers inhabit open wetlands, grasslands, open scrub and croplands (Macwhirter and Bildstein 1996). Northern harriers forage by flying low, back and forth over the ground, with males preferring to forage in more open habitats than females (Macwhirter and Bildstein 1996). Owl-like facial structures facilitate auditory prey detection in the absence of visual cues (Ryser 1985; Macwhirter and Bildstein 1996). Hunting activities generally are distributed throughout the day, but may be concentrated in the morning and evening hours to avoid extreme daytime temperatures (Macwhirter and Bildstein 1996). Primary prey includes voles and other small- and medium-sized mammals, birds, reptiles and frogs (Macwhirter and Bildstein 1996). In the summer, harriers are not strongly territorial, except around nest sites, where both sexes defend against conspecifics (Macwhirter and Bildstein 1996). In winter, females defend territories and exclude males from prime foraging areas. Harriers are generally monogamous, but males sometimes exhibit polygyny and may maintain a harem of two to five females; nests can be situated closely in polygamous situations (Ryser 1985; Macwhirter and Bildstein 1996). The local breeding season likely spans April - August. Nests are constructed on the ground usually within a patch of dense, tall vegetation. Incubation lasts 30 - 32 days with fledging occurring 34 - 45 days after hatching; only one brood is produced (Macwhirter and Bildstein 1996). Nest site fidelity appears to be weak (Macwhirter and Bildstein 1996). This species is threatened by destruction of marsh habitats, the spread of urban and agricultural development of grasslands, and overgrazing by livestock (Remsen 1978; Macwhirter and Bildstein 1996).

4.5.5.1 Local Occurrence: In Monterey County, the northern harrier is a rare summer resident and uncommon in migration and in winter (Roberson 2002). The local breeding season for harriers spans March to July. Possible breeding evidence for northern harriers has been observed in the project vicinity (Roberson and Tenney 1993). No records for this species were found in the CNDDB regional quads.

4.5.5.2 Site Assessment. During the course of this study, no northern harriers were observed on-site. However, focused surveys for this species were not performed and their nesting status remains uncertain. During a separate study in 2002-03, male and female harriers were observed foraging on-site on the Matsui parcel during the breeding season (Bryan Mori Biological Consulting Services and Biotic Resources Group 2003). The project site provides foraging habitat for this species along open, disturbed drainages, in grasslands, and ruderal and bare tilled areas. The remnant grasslands and fallow ruderal fields may provide nesting habitat for this species.

4.5.6 Cooper's Hawk. The Cooper's hawk is a State species of special concern (nesting populations) (CDFG 2004b). Cooper's hawks are permanent residents throughout the state, but less common in the coastal northwest and scarce in the southeastern deserts; the resident population is supplemented by winter migrants (Small 1994). During migration and in winter a variety of wooded habitats are used including urban landscaping. During the breeding season, it prefers deciduous, mixed-evergreen forests and deciduous riparian woodlands, favoring mature forests with dense canopy cover around nests (Palmer 1988; Rosenfield and Bielefeldt 1993). Nesting sites are within wooded stands of at least four to eight hectares (Rosenfield and Bielefeldt 1993). Cooper's hawks are monogamous and mating pairs are present on nesting territories as early as March (Rosenfield and Bielefeldt 1993). In California, nests are usually built in oaks with nests constructed on a main crotch or on a horizontal limb of a live tree. Nests are sometimes placed on top of pre-existing bases such as squirrel nests, other hawk nests and mistletoe (Palmer 1988; Rosenfield and Bielefeldt 1993). Cooper's hawks typically build new nests in the same area of previous successful nest sites and only occasionally reuse nests in successive or intermittent years (Rosenfield and Bielefeldt 1993). One brood is produced per year, but the species will re-nest when the first clutch is lost early in incubation. The clutch usually consists of three to five eggs. Incubation is mostly performed by the female and lasts 30 - 36 days. Nestlings fledge in 27 - 30 days after hatching, but return to the nest for roosting and to accept prey deliveries for about 10 days. Fledglings will remain around the nest site for five to six weeks and adults will continue to feed young for up to seven weeks (Rosenfield and Bielefeldt 1993). Home ranges during the breeding season have been estimated at 400 to 1,800 hectares (Reynolds 1983; Rosenfield and Bielefeldt 1993). Prey items typically consist of sub-adult, medium-sized birds (e.g., robins) and medium-sized mammals (e.g., chipmunks) (Rosenfield and Bielefeldt 1993). Cooper's hawks are capable of breeding at one year of age, but most breed at two years or greater. The oldest individual recorded is 12 years. Habitat loss and pesticide contamination are considered threats to this species (Remsen 1978; Rosenfield and Bielefeldt 1993).

4.5.6.1 Local Occurrence. In Monterey County, the Cooper's hawk is a rare summer resident, but fairly common in migration and uncommon in winter (Roberson 2002). The local breeding season for this species spans late March to July. Possible breeding evidence for northern harriers has been observed in the project vicinity (Roberson and Tenney 1993). No records for this species were found in the CNDDB regional quads.

4.5.6.2 Site Assessment. During the course of this study, an adult was observed foraging over the site on 12 April and a female in sub-adult plumage was seen mobbing a red fox on the Wayland parcel on 24 May (Figure 4). Also, on 24 May an active nest site was observed just off-site to the west in Natividad Creek . Focused surveys for this species were not performed and their nesting status on-site remains uncertain, but the observation of a female mobbing a red fox suggests defense of a nesting territory. The riparian woodlands along the unnamed drainage, Gabilan Creek and lower Natividad Creek may provide nesting habitat on-site for Cooper's hawks.

4.5.7 Burrowing Owl. The burrowing owl is a State species of special concern (CDFG 2004b). The California population is distributed throughout the lowlands of the state and consists of both permanent residents and winter migrants (CDFG 1990). Burrowing owls typically inhabit arid, treeless, valley and foothill grasslands, desert floors, agricultural areas and open terrain in urban settings (e.g., airports, golf courses, vacant lots, etc.) supporting populations of burrowing mammals and insects (Haug, *et al* 1993). Where ground vegetation is present, sparse, short cover is necessary. In California, nesting habitat is typically characterized by flat or gently rolling terrain (Grinnell and Miller 1944). In winter, a variety of open habitats, over a wider range of elevations, are used (B. Mori, pers. obs.). In Central California, this species depends on burrows of small mammals, most notably ground squirrels, for nesting and escape cover (Haug *et al* 1993). Artificial structures may also be utilized (Collins 1977; California Burrowing Owl Consortium 1997). Raised areas near burrows or elevated burrows serve as vantage points (Haug *et al* 1993). In non-migratory populations, the same burrows are maintained and used year-round. Burrowing owls are crepuscular in habit and found perched outside of active burrows during the day, but are also active at night (CDFG 1990; Haug *et al* 1993). Burrowing owls are opportunistic feeders, preying primarily on arthropods, small mammals and small birds (Haug *et al* 1993). In California, results of relocation efforts indicate strong site fidelity to nesting sites (Haug *et al* 1993; Delevoryas 1997; Feeney 1997). Breeding pairs are mostly monogamous, but polygyny has been reported. In western populations, pair bonds are maintained throughout the year but may not be permanent, since mate switching can take place between years. In migratory populations, males arrive at burrow sites first, then prepare the burrow and begin courtship and territorial behavior. Only one brood is produced, unless the first clutch is lost early in the nesting period. The clutch can consist of up to 11 eggs that are incubated by the female for 21 – 23 days. The male provides food to the female during incubation and initially provides food for the nestlings. As the young become less dependent, the female begins to hunt and provide food. Fledging takes place at about 44 days after hatching, but young owls will remain near nest burrows and forage with adults until dispersal in late July to August. Sexual maturity is attained in one year. Oldest age recorded is eight years. This species has experienced a serious decline throughout the state as a result of habitat loss from agriculture and urbanization, and probably from the secondary effects of ground squirrel poisoning programs (Remsen 1978). DeSante *et al* (1997) indicated that the central California burrowing owl breeding population may be as low as 925 pairs, and that the breeding population of burrowing owls in central California has declined by 65% over the decade spanning 1981-91.

4.5.7.1 Local Occurrence. The burrowing owl is a rare local resident in Monterey County, with the current populations centered around Salinas and east of King City (Roberson 2002). The local breeding season spans March through July. The resident population is likely augmented by migrants, which are expected to arrive from September and remain through March. A nesting population is present at the Salinas Airport and between State Route 101 and HWY 183(CDFG 2004a). Burrowing owls formerly bred near the County Maintenance Facility at East Laurel Drive (G. Kittleson, pers. comm.).

4.5.7.2 Site Assessment. No burrowing owls were observed during the 2004 focused nesting surveys, despite the presence of potential habitat on the Andrus parcel, where ground squirrel burrows were abundant and the vegetation height appeared optimal due to grazing. One owl pellet was observed at a den entrance on the Andrus parcel during the initial ground search for dens and evidence of occupancy (Figure 4). Most of the remainder of the study site was unsuitable as denning habitat due to row crop agriculture. Even on fields that were not farmed, discing and/or tall vegetation height created unsuitable microhabitat conditions. Although not observed to nest on-site in 2004, the owl pellet indicated that the site was used during migration or winter. Also, the remnant grasslands in the study area may support nesting owls in the future.

4.5.8 Loggerhead Shrike. The loggerhead shrike is a State species of special concern (breeding population) (CDFG 2004b). The shrike is found throughout California except for most of the northwest and along the Cascade-Sierran ranges (CDFG 1990). Loggerhead shrikes inhabit valley and foothill grasslands, wetlands and agricultural areas supporting scattered trees and shrubs (Ehrlich *et al* 1988; CDFG 1990; Yosef 1996). Shrikes feed on insects, reptiles, small mammals, birds and carrion (CDFG 1990; Yosef 1996). Areas of bare ground and short cover are preferred for hunting (Yosef 1996). Shrikes are sit-and-wait predators and, where available, favor perching on fence lines, utility lines and poles in search of prey (Yosef 1996). When stalking prey on the ground, shrikes raise their wings half-opened in a stereotyped manner, perhaps to startle prey (Yosef 1996). Due to the absence of talons, large prey are impaled on thorns or barbed wire to facilitate consumption or to establish a cache for future use (Ehrlich *et al* 1988; Yosef 1996). Shrikes are highly territorial and maintain relatively large areas compared to other birds of similar size. Territories are defended mostly through song rather than fighting (Yosef 1996). In California, pairs disband in winter with each sex holding separate adjacent territories, presumable because of the scarcity of prey. Resident birds are monogamous. The breeding season spans March - August (CDFG 1990). This species exhibits high site fidelity and nests are often reused (Yosef 1996). Nests are usually built in densely foliaged trees and shrubs, preferably with thorns (CDFG 1990; Yosef 1996); however, structures such as telephone poles, abandoned buildings and machinery, and brush piles are also used (Yosef 1996; B. Mori, pers. obs.). Up to five eggs are laid and incubation lasts 16 days, with fledging occurring about 20 days after hatching (Yosef 1996). Two to three broods are produced each year. The loggerhead shrike has been experiencing a significant decline throughout its range in the U.S. and Canada (Tate 1986; Ehrlich *et al* 1992; Peterjohn and Sauer 1995). Habitat loss and pesticide contamination has been identified as factors contributing to this species' decline (Ehrlich *et al* 1988; Peterjohn and Sauer 1995; Yosef 1996).

4.5.8.1 Local Occurrence. The loggerhead shrike is an uncommon resident in Monterey County, with numbers supplemented by winter migrants (Roberson 2002). Shrikes have been documented to nest in the project vicinity (Roberson and Tenney 1993). No records for this species were found in the local CNDDB Quads. The local nesting season likely spans from March through July.

4.5.8.2 Site Assessment. No nesting shrikes were observed on-site during the course of this study, however focused surveys for this species were not performed and their nesting status on-site remains uncertain. The remnant grasslands on the study site provide potential nesting habitat, particularly where scattered trees and shrubs are present, such as along the northern fence line of the Andrus parcel. One shrike was observed on-site on 2 November 2004. Shrikes may nest on-site in the future, since nesting has been documented nearby.

4.5.9 California Horned Lark. The California horned lark is a State species of special concern (breeding population) (CDFG 2004a). The subspecies *E. a. actia* is distributed along the coast from Sonoma County south to San Diego County and inland throughout the San Joaquin

Valley (Grinnell and Miller 1944). Horned larks show a preference for habitat characterized by bare ground and low, sparse ground vegetation. These microhabitats include grasslands of level to moderate relief, mountain meadows, open coastal plains, alkali flats, active and fallow hayfields and bare croplands (Grinnell and Miller 1944; CDFG 1990; Beason 1995). Horned larks forage mostly on seeds in winter but supplement their diet with grasshoppers, beetles and lepidopteran larvae during spring and fall (Beason 1995). Territories are regularly spaced during the nesting period but small mono-specific flocks of young birds form soon after fledging and, by late summer, adults join the flocks, which can increase in size to several hundred by winter (Beason 1995). Winter flocks are nomadic and wander over large areas in search of food (Beason 1995). Resident birds begin defending nesting areas by January and February (Beason 1995). Horned larks are apparently monogamous for at least one season, but polygyny occurs when a male holding territory dies and is replaced by a neighboring male (Beason 1995). Nests are built by females on bare ground in natural depressions or depressions created by the female, usually behind a tuft of grass or other object to provide shelter from wind (Ehrlich *et al* 1988; Beason 1995). Incubation is between 11- 13 days, with fledging occurring 8 - 10 days after hatching; fledglings are not capable of flight until a few days later (Beason 1995). Horned larks produce two broods. Nest site fidelity appears to be strong in horned larks (Beason 1995). Agricultural operations are believed to destroy many nests (Ehrlich *et al* 1988).

4.5.9.1 Local Occurrence. Horned larks are common, localized residents in Monterey County, with numbers supplemented in the winter by migrants (Roberson 2002). Local nesting locations include the lower Salinas Valley up to Fremont Peak (Roberson and Tenney 1993). No records for this species were found in the local CNDDB Quads. The local nesting season spans from March through June.

4.5.9.2 Site Assessment. During the course of this study, horned larks were observed in scattered localities throughout the study area (Figure 4). Observations of nesting behavior included singing males, pairs and territory defense during the breeding season in grazed grasslands, as well as agricultural fields. During a separate study, confirmed evidence of nesting was observed on fallow and bare fields on the Matsui parcel in 2002, immediately north of the Andrus parcel. Despite the expansion of row crop agriculture on the Matsui parcel in 2003, horned larks returned and appeared to make opportunistic use of remnant bare and ruderal patches, as well as rows between crops (Bryan Mori Biological Consulting Services 2003). This observation suggests that this species exhibits strong site fidelity, and will return to natal nesting habitat, so long as nesting is successful. Although nesting has been confirmed, the distribution of nesting birds on-site remains uncertain, since focused surveys for this species were not performed. Grazed grasslands and bare fields throughout the study site should be considered potential nesting habitat.

4.5.10 Yellow Warbler. The yellow warbler is a State species of special concern (breeding population) (CDFG 2004b). Yellow warblers are primarily summer residents and, in the breeding season, are distributed throughout the state, but absent or rare along the Sierra crest, in the Central Valley and southeastern deserts (CDFG 1990; Small 1994). They winter locally in small numbers in Southern California (CDFG 1990; Small 1994). Breeding populations are closely associated with perennial streams supporting riparian vegetation composed of dense willow thickets and taller trees such as cottonwoods, sycamores and alders (Grinnell and Miller 1944). Outside the breeding season, this species may occur in a variety of habitats including oak woodlands, coniferous forests, orchards and urban landscaping, but is still most numerous in riparian corridors (Grinnell and Miller 1944; Small 1994). Yellow warblers are primarily insect gleaners but occasionally will "hawk" (take insects in flight) or hover when foraging (Lowther *et al* 1999). In California, the nesting season generally spans April through August. Mating pairs are monogamous, at least through the breeding season, with some reports of polygyny (Lowther *et al* 1999). Mate fidelity in successive years has been reported, when mates from the previous season are available (Lowther *et al* 1999). Males arrive to nesting grounds first and often select tall trees from which to broadcast their courtship and territorial songs (Schroeder 1982). Nest building usually takes place within one to four days after the female's arrival (Lowther *et al* 1999). Deep cup nests of grasses, bark and other plant fibers are placed low, from three to six feet from the ground in the upright fork of a shrub, sapling or tree in dense vegetation to conceal the nest from predators and brood-parasites (Knopf and Sedgwick 1992). Yellow warblers produce one brood in late May to early June, but will re-nest if the clutch is lost or parasitised by cowbirds early in the season (Lowther *et al* 1999). The clutch typically consists of four to five eggs, and only the female performs incubation (Lowther *et al* 1999). Females will leave the nest to forage, but the male may also feed the female during incubation (Lowther *et al* 1999). The eggs hatch in about 11 - 12 days. Both parents feed the nestlings, which fledge in 8 - 12 days after hatching. The young remain with the parents for up to 21 days after leaving the nest. By mid-August, birds begin to disperse and migrate southward. Sexual maturity is reached in one year. The oldest age recorded is 8 years 11 months. Yellow warblers are threatened by loss of riparian habitat and nest parasitism by the brown-headed cowbird (*Molothrus ater*) (Remsen 1978; Lowther *et al* 1999). While yellow warblers do respond to cowbird parasitism by ejecting eggs or deserting nests, this behavior occurs only 50% of the time if cowbird eggs are laid during the first-half of the egg-laying period, after which rejection drops to zero (Robinson *et al 1995*).

4.5.10.1 Local Occurrence. Yellow warblers are fairly common summer residents of inland riparian woodlands of Monterey County (Roberson 2002). Nesting yellow warblers have been recorded in the project vicinity (Roberson and Tenney 1993). No records for this species were found in the regional CNDDB Quads. The local nesting season spans April through July.

4.5.10.2 Site Assessment. Singing male yellow warblers were observed in riparian habitat on 18 May at Gabilan and lower Natividad Creeks; 27 May along lower Natividad Creek; and 24 May in the remnant oak woodland (Figure 4). Although focused surveys for this species were not performed, the observations of singing males during the breeding season suggest that nesting may have occurred on-site in 2004. During a separate study in 2002-03, a singing male was observed on the Matsui parcel from April through June, suggesting that the riparian woodlands on-site are used by nesting birds annually. Riparian woodlands of lower Natividad Creek, Gabilan Creek and the unnamed drainage provide potential nesting habitat for this species.

4.5.11 Tricolored Blackbird. The tricolored blackbird is a State species of special concern (breeding population) (CDFG 2004b). Tricolored blackbirds are mostly endemic to California but also occur uncommonly in Oregon and Baja California (Beedy and Hamilton 1997). Their range in California includes the Sacramento and San Joaquin Valleys, the foothills of the Sierra Nevada, and the foothills and valleys of the Coast Ranges, but the main populations are located in the Central Valley (Beedy and Hamilton 1997). Tricolored blackbirds are among the most colonial of passerine birds in North America (Beedy and Hamilton 1997). A single colony can consist of up to 200,000 birds with nest sites often built within one foot of each other; although large colonies are now uncommon (Beedy *et al* 1991; Beedy and Hamilton 1997). Tricolored blackbirds are nomadic breeders adapted at exploiting seasonal habitats and resources such as seasonal water sources and cyclic food supplies (e.g., grasshopper outbreaks) (Beedy and Hamilton 1997; Hamilton 1998). During the summer their diet consists mostly of insects, whereas, in winter, plant material makes up the bulk of their diet. Tricoloreds are widespread during the non-breeding season, when large flocks gather in agricultural fields and pastures. Nesting habitats include freshwater marshes with dense tules, cattails, brambles or willows;

however, vegetation of non-marsh habitats is also used, such as thistle and mustard patches, hayfields and grasslands (Beedy and Hamilton 1997). Nesting sites must consist of nearby water, foraging areas located within a few kilometers of the nesting colony, and provide protection from predators (Beedy and Hamilton 1997). Successful nesting sites will be reused in subsequent years. Initial spring breeding begins from March to April. Nest building is highly synchronous and performed by the females, and nest construction may be initiated from the first day of arrival at a colony (Beedy and Hamilton 1997). Egg-laying usually takes place after four days of arriving at the colony, with the clutch consisting of three to four eggs. Males are highly vocal until the last egg is laid. Incubation takes from 11 - 14 days, with fledging occurring 24 days after hatching (Beedy and Hamilton 1997). Re-nesting may occur far from the initial nesting site after successful or failed attempts (Hamilton 1998), recommencing as early as 50 days later in May and June (Hamilton 1998). Juveniles are not likely to return to natal sites (DeHaven *et al.* 1975a). Females reach sexual maturity in one year, while males tend to breed after reaching two-years of age (Beedy and Hamilton 1997). Human disturbances, inclement weather and agricultural operations can lead to widespread nesting failure (Beedy and Hamilton 1997). The recent population trend indicates a decline between 1994 and 1997 (Beedy and Hamilton 1997). Loss of freshwater wetlands has significantly contributed to this species' decline in California (DeHaven *et al* 1975b; Beedy *et al* 1991).

4.5.11.1 Local Occurrence. In Monterey County, tricolored blackbirds are locally common summer residents of lowlands, becoming widespread in winter (Roberson 2002). Nesting colonies have been recorded in the project site vicinity (Roberson and Tenney 1993). One such colony is present in an irrigation pond just south of the study site, near the corner of Williams Road and Old Stage Road (B. Mori, pers. obs.). No records for this species were found in the regional CNDDB Quads. The local nesting season spans late March through June.

4.5.11.2 Site Assessment. Large flocks of tricolored blackbirds were regularly seen foraging on the remnant grasslands on the study site. No nesting colonies were observed on-site during this study. Although focused surveys for this species were not performed, this species likely did not nest on-site in 2004, since potential nesting habitat (freshwater marsh with dense emergent vegetation) was generally lacking, and where present, tricolored blackbirds were not observed. Since nesting colonies typically contain large numbers of birds (e.g., hundreds to thousands), it is unlikely that nesting was overlooked. However, since tricoloreds are known to change nesting sites between and within seasons, this species could nest on-site in the future, if optimal conditions are present. An example of a potential nest site is the dense bulrush patch in the unnamed drainage on the Wayland parcel, which supported a nesting colony of red-winged blackbirds (*Agelaius phoeniceus*) during this study.

4.5.12 Pallid Bat. The pallid bat is a State species of special concern (CDFG 2004b). Pallid bats are found throughout the state in a variety of habitats at low and mid-elevations including deserts, scrub and coniferous forests (Brown and Pierson 1996). In central California, pallid bats mostly inhabit oak woodlands, ponderosa pine and redwood forests (Brown and Pierson 1996). Pallid bats are year-round residents, moving about locally on a seasonal basis and hibernating in winter (Brown and Pierson 1996). During the day pallid bats roost in buildings, rock crevices, caves, mines and especially hollow trees (Brown and Pierson 1996). Temperature is a limiting factor for pallid bats, which are intolerant of microclimates above 40^0 C; therefore, roost sites that provide a varied temperature regime are selected (CDFG 1990; Brown and Pierson 1996). Pallid bats commonly use bridges as night roosts and show strong site fidelity to such roost sites (Pierson *et al* 1996). Segregated colonies are common, but both sexes can be found together at roost sites (Tuttle 1988). Mating begins in late October and lasts until March (Tuttle 1988).

Maternity roosts are colonial and may contain several hundred females, which give birth to one to two young per year from May to June. Young learn to fly at about six weeks of age (Tuttle 1988). The colony is maintained from spring through the fall when bats disperse after the young have learned to fly and forage on their own. Pallid bats divide into smaller groups in fall and aggregations in winter are smaller than in summer (Tuttle 1988; Pierson 1998). Pallid bats glean moths from leaves and will land on the ground to forage on large arthropods, especially Jerusalem crickets (Brown and Pierson 1996). Pallid bats are sensitive to human disturbances at roost sites (CDFG 1990; Brown and Pierson 1996). Timber harvests, suburban development of oak woodlands and mining operations have been implicated in the decline of this species in California (Brown and Pierson 1996).

4.5.12.1 Local Occurrence. The occurrence of pallid bats in the study area is uncertain, since no records are listed in the CNDDB regional Quads.

4.5.12.2 Site Assessment. During the course of this study, no pallid bats were observed. Their status on the study site is uncertain, since focused surveys were not performed. Pallid bats likely inhabit the site, possibly roosting in large hollowed oaks, such as those found in the remnant oak woodland, and perhaps ranch structures, especially those that do not receive frequent use.

4.5.13 Monterey Dusky-footed Woodrat. The Monterey dusky-footed woodrat is a State species of special concern (CDFG 2004b). This subspecies is distributed through the northern Santa Lucia Mountains from north Monterey County south through much of San Luis Obispo County (Hall 1981). The dusky-footed woodrat is most common in riparian, oak woodland and scrub habitats, but is able to persist in semi-rural areas in proximity to houses, if patches of native habitat are present (M. Allaback, pers. obs.). A study of this subspecies on Camp Roberts found that densities in oak woodland increased significantly if dense under-story was present; densities reached 46.7 animals per hectare in plots of dense vegetation (Tietje 1995). Woodrats typically build middens (nests) of sticks and other debris on the ground, in the lower branches of trees and occasionally in human-made structures. Middens are often reused by successive generations and some can become six feet or more in height. Other atypical dens, including tree cavities, rock crevices and ground holes, are well hidden and easily overlooked. Middens are used for rearing young, protection from predators, resting, food storage, thermal protection and social interaction (Carraway and Verts 1991). Individual woodrats can use and maintain more than one midden and, occasionally, more than one woodrat can occupy a den (Fargo and Laudenslayer 1999). Woodrat middens are also used by a wide variety of native amphibians, small mammals, reptiles and insects (Ingles 1965; Carraway and Verts 1991). Woodrats feed on a variety of plant material, including seeds, nuts, berries and leaves, oftentimes foraging above the forest floor (Jameson and Peeters 1988). Woodrat home ranges may cover 46.2 acres, but activity may also be limited to a single tree over an individual's lifetime (CDFG 1990). They are mostly nocturnal in habit and active throughout the year. Dusky-footed woodrats breed year-round and may produce up to five litters per year, with litters containing one to four young (CDFG 1990). Development of oak woodlands and clearing of brushy under-story are possible threats to this species.

4.5.13.1 Local Occurrence. The CNDDB does not contain information on dusky-footed woodrats in the study region. However, the known range of this species extends throughout the northern-half of the Santa Lucia Range and into the Salinas Valley (Hall 1981).

4.5.13.2 Site Assessment. During the course of this study, Monterey dusky-footed woodrat middens were not observed, however focused surveys for this species were not performed and their status on-site remains uncertain. They may inhabit the tree canopy of the remnant oak woodland and/or the understory of riparian woodlands along Gabilan Creek, Natividad Creek and the unnamed drainage, where vegetation is dense and broad. The habitat quality may be marginal due to adjacent agricultural operations, ground squirrel control and habitat fragmentation.

Appendix A
Vascular Plant Checklist – Salinas Annexation Project, 2004

FERNS AND FERN ALLIES

EQUISETACEAE

Equisetum arvense (common horsetail)

CONIFERS

CUPRESSACEAE

Cupressus macrocarpa (Monterey cypress)

PINACEAE

Pinus radiata (Monterey pine)

FLOWERING PLANTS-DICOTS

ANACARDIACEAE

Toxicodendron diversilobum (poison oak)

APIACEAE

*Conium maculatum** (poison hemlock)
*Foeniculum vulgare** (fennel)
Oenanthe sarmentosa (water parsley)
Sanicula bipinnatifida (purple sanicle)

ARALIACEAE

*Hedera helix** (English ivy)

ASTERACEAE

Achillea millefolium (yarrow)
*Anthemis cotula**(dog fennel)
Artemisia douglasiana (mugwort)
Baccharis pilularis (coyote brush)
*Carduus pycnocephalus** (Italian thistle)
***Centromadia parryi* ssp. *congdonii* (Condgons's tarwplant)**
*Chamomilla suaveolens** (pineapple weed)
*Cirsium arvense** (Canada thistle)
Delaireia odorata * (German ivy)
*Filago gallica** (common filago)
Hemizonia corymbosa (corymbose tarweed)
Heterotheca grandiflora (telegraph weed)
*Hypochoeris glabra** (smooths cat's ear)
*Hypochoeris radicata** (rough cat's ear)
*Lactuca saligna** (willow lettuce)
*Lactuca serriola** (prickly lettuce)
Madia gracilis (slender tarweed)
*Picris echioides** ((bristly ox-tongue)
*Silybum marianum** (milk thistle)
*Sonchus asper** (prickly sow thistle
*Taraxacum officinale** (dandelion)
Wyethia angustifolia (narrow-leaved mule's ears)
Xanthium strumarium (cocklebur)

BORAGINACEAE

Amsinckia vernicosa (green fiddleneck)
Amsinckia menziesii var. *intermedia* (rancher's fiddleneck)
Amsinckia spectabilis var. *spectabilis* (seaside fiddleneck)
Cryptantha clevelandii (Cleveland's cryptantha)
Heliotropium curassavicum (heliotrope)
Plagiobothrys nothofulvus (popcorn flower)

BRASSICACEAE
*Brassica rapa** (field mustard)
*Capsella bursa-pastoris** (shepard's purse)
Lepidium nitidum (shining pepper-grass)
*Lepidium densiflorum** (common pepper-grass)
*Raphanus sativus** (radish)
Rorippa nasturtium-aquaticum (water cress)

CAPRIFOLIACEAE
Sambucus mexicana (blue elderberry)

CARYOPHYLLACEAE
*Silene gallica** (common catchfly)
*Stellaria media** (common chickweed)

CHENOPODIACEAE
*Chenopodium album** (lamb's quarters

CONVOLVULACEAE
Calystegia subacaulis (hill morning-glory)
*Convolvulus arvensis** (bindweed)

EUPHORBIACEAE
Eremocarpus setigerus (dove weed)
*Euphorbia lathyris** (gopher plant)

FABACEAE
*Lotus corniculatus** (birdfoot trefoil)
Lupinus bicolor (miniature lupine)
Lupinus nanus (annual lupine)
*Medicago polymorpha** (California bur clover)
*Melilotus indica** (sour clover)
Trifolium campestre (hop clover)
*Trifolium hirtum** (rose clover)
*Trifolium subterraneum** (subterraneaum clover)
Vicia sativa ssp. *nigra** (narrow-leaved vetch)
Vicia villosa (woolly vetch)

FAGACEAE
Quercus agrifolia (coast live oak)

GERANIACEAE
*Erodium botrys** (long-beaked filaree)
*Erodium cicutarium** (red-stemmed filaree)
*Erodium moschatum** (white-stemmed filaree)
*Geranium carolinianum** (Carolina geranium)

LAMIACEAE
Lamium purpureum (red henbit)
*Marrubium vulgare** (horehound)

MALVACEAE
*Malva neglecta** (cheeseweed)
*Malva parviflora** (cheeseweed)

MYRTACEAE
*Eucalyptus globulus** (blue gum eucalyptus)

ONAGRACEAE
Camissonia ovata (sun cup)
Epilobium ciliatum ssp. *ciliatum* (ciliate willow herb)

OXALIDACEAE
*Oxalis pes-caprae** (Bermuda buttercup)

PAPAVERACEAE
Eschscholtzia californica (California poppy)

PLANTAGINACEAE
*Plantago coronopus** (cut-leaved pantain)
*Plantago lanceolata** (English plantain)

PLATANACEAE
Platanus racemosa (western sycamore)

POLYGONACEAE
Polygonum amphibium var. *emersum* (water smartweed)
*Polygonum arenastrum** (common knotweed)
Polygonum lapathifolium (willow weed)
*Polygonum persicaria** (lady's thumb)
*Rumex acetosella** (sheep sorrel)
*Rumex crispus** (curly dock)
*Rumex obtusifolius** (bitter dock)
Rumex salicifolius (willow dock)

PORTULACACEAE
Calandrinia ciliata (red maids)
Claytonia perfoliata ssp. *perfoliata* (miner's lettuce)

PRIMULACEAE
*Anagallis arvensis** (scarlet pimpernel)

RANUNCULACEAE
*Ranunculus parviflorus** (small-flowered buttercup)

ROSACEAE
*Acaena novae-zelandiae** (biddy-biddy)
Rosa californica (California rose)
*Rubus discolor** (Himalaya berry)
Rubus ursinus (California blackberry)

SALICACEAE
Populus balsamifera ssp. *trichocarpa* (black cottonwood)
Salix lasiolepis (arroyo willow)
Salix lucida ssp. *lasiandra* (shining willow)

SCROPHULARIACEAE
Castilleja exserta ssp. *exserta* (pink owls clover)
Triphysaria versicolor (San Francisco orthocarpus)
*Veronica anagallis-aquatica** (water speedwell)

URTICACEAE
Urtica dioica ssp. *gracilis* (stinging nettle)

VERBENACEAE
Verbena sp. (vervain)

VIOLACEAE
Viola pedunculata (Johnny jump-up)

FLOWERING PLANTS - MONOCOTS

CYPERACEAE
Cyperus eragrostis (eragrostid sedge)
Cyperus erythrorhizos (red-rooted sedge)
Eleocharis macrostachya (pale spikerush)
Scirpus californicus (California bulrush)

IRIDACEAE
Sisyrinchium bellum (blue-eyed grass)

JUNCACEAE
Juncus bufonius var. *bufonius* (toad rush)
Juncus patens (spreading rush)
Juncus occidentalis (western rush)

LILIACEAE
Chlorogalum pomeridianum (Indian soap plant)
Triteleia ixioides ssp. *ixioides* (golden brodiaeca)

POACEAE
*Agrostis capillaris** (colonial bent)
Avena sp. * (wild oat)
*Briza minor** (quaking grass)
Bromus carinatus var. *carinatus* (California brome)
*Bromus diandrus** (ripgut brome)
*Bromus hordeaceus** (soft chess)
Bromus madritensis ssp. *rubens** (red brome)
*Cynodon dactylon** (Bermuda grass)
*Cynosurus echinatus** (dogtail grass)
Danthonia californica var. *californica* (California oatgrass)
*Danthonia pillosa** (hairy oatgrass)
Elymus glaucus (blue wild rye)
*Holcus lanatus** (velvet grass)
Hordeum branchyantherum (meadow barley)
Hordeum murinum ssp. *leporinum** (wall barley)
*Lolium multiflorum** (Italian ryegrass)
Nassella pulchra (purple needlegrass)
*Phalaris aquatica** (Harding grass)
*Phalaris angusta** (canary grass)
*Poa annua** (annual bluegrass)
*Polypogon monspeliensis** (rabbitsfoot grass)
Vulpia myuros var. *myuros** (rattail fescue)

TYPHACEAE
Typha angustifolia (narrow-leaved cattail)

NOTES:
special status plants (RTE's) appear in **bold type**
* = non-native species
nomenclature from Jepson Manual (Hickman 1993)

APPENDIX B

Wildlife Species Observed on or Adjacent to the Salinas Annexation Site
7 April - 27 May 2004.

Key: a =Observed; aerial transient
n= Observed and known or expected to nest in the project vicinity
o= Observed on or adjacent to the project site; non-breeder
s= Sign (tracks, burrow, scat, etc.)

CLASS: AMPHIBIA

FAMILY: AMBYSTOMATIDAE (Mole Salamanders and Relatives)	
California Tiger Salamander (*Ambystoma tigrinum californiense*)	o
FAMILY: BUFONIDAE (True Toads)	
Western Toad (*Bufo boreas*)	o
FAMILY: HYLIDAE (Treefrogs and Relatives)	
Pacific Treefrog (*Hyla regilla*)	o
FAMILY: RANIDAE (True Frogs)	
California Red-legged Frog (*Rana aurora draytoni*)	o
Bullfrog (*Rana catesbeiana*)	o

CLASS: REPTILIA

FAMILY: EMYDIDAE (Pond and Marsh Turtles)	
Southern Pacific Pond Turtle (*Actinemys marmorata pallida*)	o
FAMILY: IGUANIDAE (Iguanids)	
Western Fence Lizard (*Sceloporus occidentalis*)	o
FAMILY: COLUBRIDAE (Colubrids)	
Western Yellow-bellied Racer (*Coluber constrictor*)	o
Gopher Snake (*Pituophis catenifer*)	o
California Red-sided Garter Snake (*Thamnophis sirtalis infernalis*)	o

CLASS: AVES

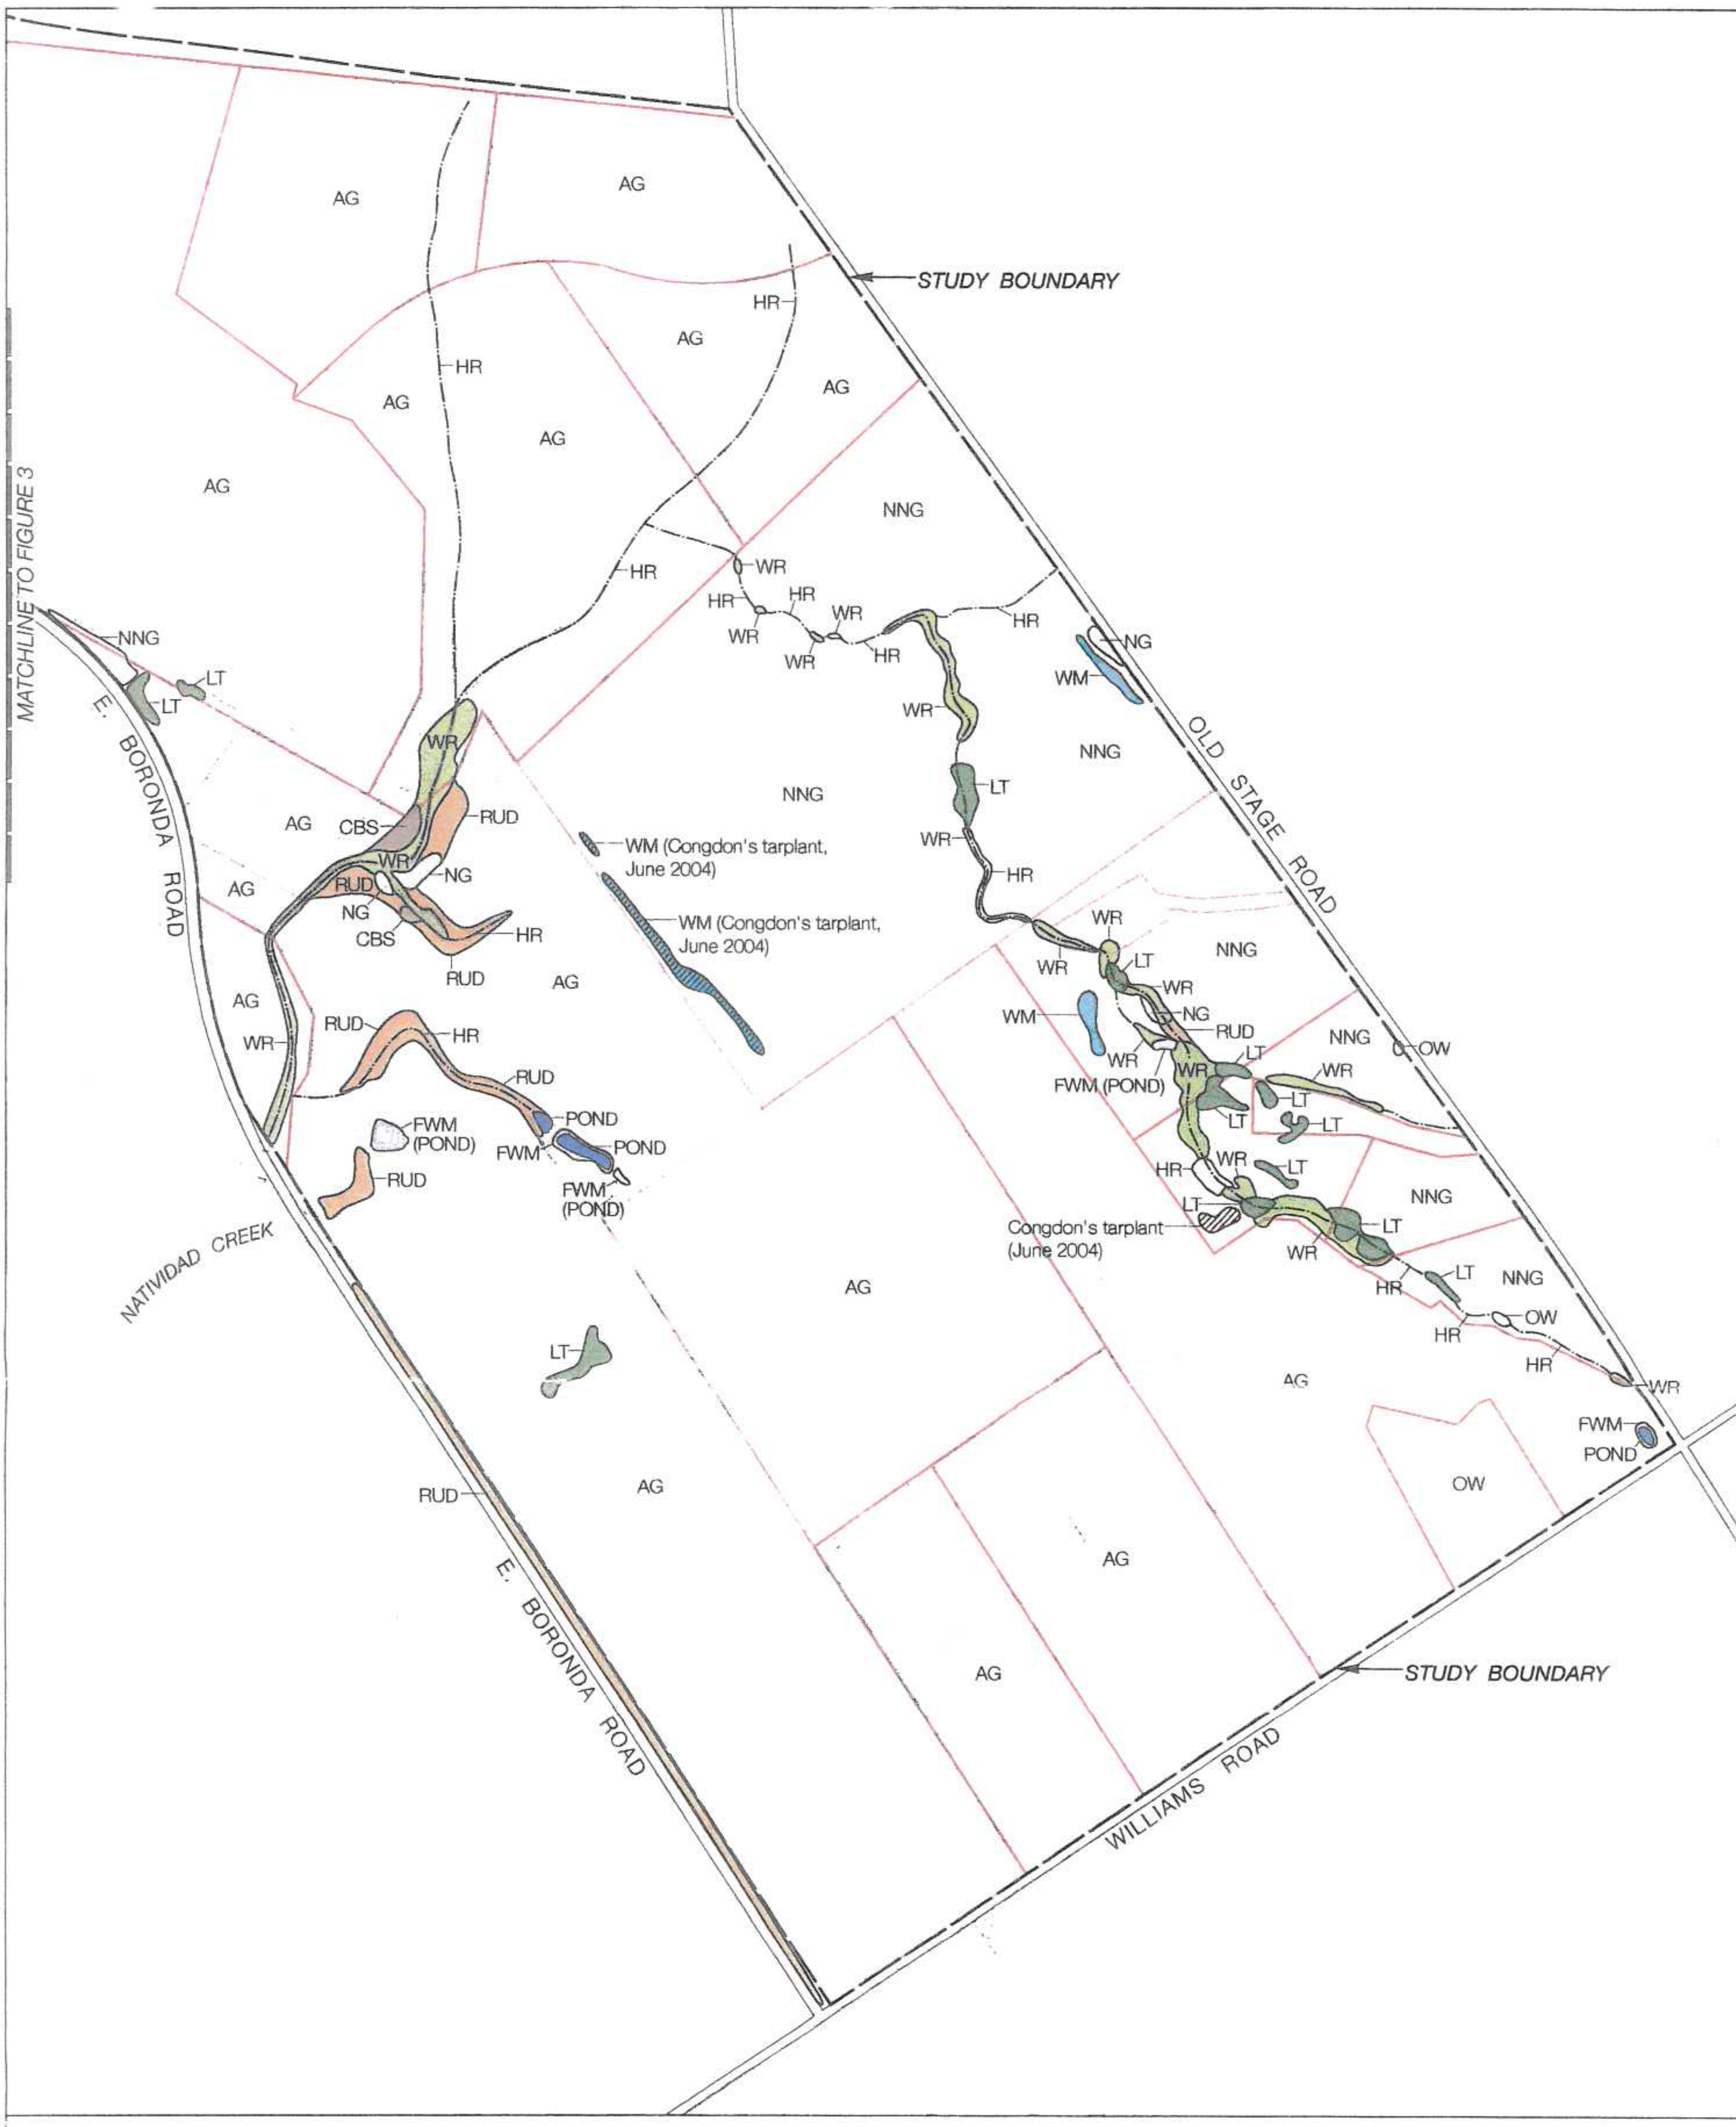
FAMILY: CATHARTIDAE (American Vultures)	
Turkey Vulture (*Cathartes aura*)	o
FAMILY: ANATIDAE (Swans, Geese, and Ducks)	
Canada Goose (*Branta canadensis*)	n?

Mallard (Anas platyrhynchos)	n
FAMILY: ACCIPITRIDAE (Hawks, Harriers and allies)	
White-tailed Kite (*Elanus leucurus*)	n?
Northern Harrier (*Circus cyaneus*)	n?
Red-tailed Hawk (*Buteo jamaicensis*)	n
Red-shouldered Hawk (*Buteo lineatus*)	n
Golden Eagle (*Aquila chrysaetos*)	o
FAMILY: FALCONIDAE (Caracaras and Falcons)	
American Kestrel (*Falco sparverius*)	n
FAMILY: CHARADRIIDAE (Plovers and Relatives)	
Killdeer (*Charadrius vociferus*)	n
FAMILY: LARIDAE (Gulls and Terns)	
Caspian Tern (*Sterna caspia*)	a
FAMILY: SCOLOPACIDAE (Sandpipers and Relatives)	
Wilson's Snipe (*Gallinago delicata*)	o
Whimbrel (*Numenius phaeopus*)	o
Long-billed Curlew (*Numenius americanus*)	o
FAMILY: COLUMBIDAE (Pigeons and Doves)	
Rock Pigeon (*Columba livia*)	o
Band-tailed Pigeon (*Patagioenas fasciata*)	a
Mourning Dove (*Zenaida macroura*)	n
FAMILY: STRIGIDAE (Owls)	
Great Horned Owl (*Bubo viginianus*)	n
Burrowing Owl (*Athene cunicularia*)	s, n?
FAMILY: APODIDAE (Swifts)	
Vaux's Swift (*Chaetura vauxi*)	a
FAMILY: TROCHILIDAE (Hummingbirds)	
Anna's Hummingbird (*Calypte anna*)	n
Allen's Hummingbird (*Selasphorus sasin*)	n
FAMILY: PICIDAE (Woodpeckers)	
Nuttall's Woodpecker (*Picoides nuttallii*)	n
Downy Woodpecker (*Picoides pubescens*)	n
FAMILY: TYRANNIDAE (Tyrant Flycatchers)	
Pacific-slope Flycatcher (*Empidonax difficilis*)	n
Black Phoebe (*Sayornis nigricans*)	n
Ash-throated Flycatcher (*Myiarchus cinerascens*)	n?

Western Kingbird (*Tyrannus verticalis*)	n
Cassin's Kingbird (*Tyrannus vociferans*)	n
FAMILY: VIREONIDAE (Vireos)	
Warbling Vireo (*Vireo gilvus*)	n?
Hutton's Vireo (*Vireo huttonii*)	n
FAMILY: CORVIDAE (Jays, Magpies, and Crows)	
Western Scrub-Jay (*Aphelocoma californica*)	n
American Crow (*Corvus brachyrhynchos*)	n?
Common Raven (*Corvus corax*)	a
FAMILY: ALAUDIDAE	
Horned Lark (*Eremophila alpestris*)	n
FAMILY: HIRUNDINIDAE (Swallows)	
Tree Swallow (*Tachycineta bicolor*)	n?
Northern Rough-winged Swallow (*Stelgidopteryx serripennis*)	n
Cliff Swallow (*Petrochelidon pyrrhonota*)	n
Barn Swallow (*Hirundo rustica*)	n
FAMILY: PARIDAE (Chickadees and Titmice)	
Chestnut-backed Chickadee (*Poecile rufescens*)	n
Oak Titmouse (*Baeopholus inornatus*)	n
FAMILY: AEGITHALIDAE (Bushtit)	
Bushtit (*Psaltriparus minimus*)	n
FAMILY: TROGLODYTIDAE (Wrens)	
Bewick's Wren (*Thryomanes bewickii*)	n
House Wren (*Troglodytes aedon*)	n
FAMILY: TURDIDAE (Thrushes, Robins, Bluebirds and allies)	
Western Bluebird (*Sialia mexicana*)	n
Swainson's Thrush (*Catharus ustulatus*)	n
American Robin (*Turdus migratorius*)	n
FAMILY: MIMIDAE (Mockingbirds)	
Northern Mockingbird (*Mimus polyglottos*)	n
FAMILY: STURNIDAE (Starlings)	
European Starling (*Sturnus vulgaris*)	n
FAMILY: BOMBYCILLDAE (Waxwings)	
Cedar Waxwing (*Bombycilla cedrorum*)	o
FAMILY: PARULIDAE (Wood Warblers)	

Orange-crowned Warbler (*Vermivora celata*)	n?
Yellow Warbler (*Dendroica petechia*)	n
Yellow-rumped Warbler (*Dendroica coronata*)	o
Wilson's Warbler (*Wilsonia pusilla*)	n
Common Yellowthroat (*Geothlypis trichas*)	n
FAMILY: EMBERIZIDAE (Towhees, Sparrows, Longspurs and allies)	
Spotted Towhee (*Pipilo maculatus*)	n
California Towhee (*Pipilo crissalis*)	n
Savannah Sparrow (*Passerculus sandwichensis*)	n
Grasshopper Sparrow (*Ammodramus savannarum*)	n
Song Sparrow (*Melospiza melodia*)	n
Golden-crowned Sparrow (*Zonotrichia atricapilla*)	o
White-crowned Sparrow (*Zonotrichia leucophrys*)	o
FAMILY: CARDINALIDAE	
Black-headed Grosbeak (*Pheucticus melanocephalus*)	n
Lazuli Bunting (*Passerina amoena*)	n?
FAMILY: ICTERIDAE (Blackbirds, Orioles and allies)	
Red-winged Blackbird (*Agelaius phoeniceus*)	n
Tricolored Blackbird (*Agelaius tricolor*)	n
Brewer's Blackbird (*Euphagus cyanocephalus*)	n
Western Meadowlark (*Sturnella neglecta*)	n
Brown-headed Cowbird (*Molothrus ater*)	n
Hooded Oriole (*Icterus cucullatus*)	n
Bullock's Oriole (*Icterus galbula*)	n
FAMILY: FRINGILLIDAE (Finches)	
Purple Finch (*Carpodacus purpureus*)	n
House Finch (*Carpodacus mexicanus*)	n
Lesser Goldfinch (*Carduelis psaltria*)	n
Lawrence's Goldfinch (*Carduelis lawrencei*)	n
American Goldfinch (*Carduelis tristis*)	n
CLASS: MAMMALIA	
FAMILY: DIDELPHIDAE (Opossums)	
Virginia Opossum (*Didelphis virginiana*)	s
FAMILY: LEPORIDAE (Rabbits and Hares)	
Brush Rabbit (*Sylvilagus bachmani*)	o
Desert Cottontail (*Sylvilagus audubonii*)	o
Black-tailed Jackrabbit (*Lepus californicus*)	o
FAMILY: SCIURIDAE (Squirrels, Chipmunks, and Marmots)	
California Ground Squirrel (*Spermophilus beechyii*)	o

FAMILY: GEOMYIDAE (Pocket Gophers)	
Botta's Pocket Gopher (*Thomomys bottae*)	o
FAMILY: CRICETIDAE	
Western Harvest Mouse (*Reithrodontomys megalotis*)	o
California Vole (*Microtus californicus*)	o
Muskrat (*Ondatra zibethicus*)	o
FAMILY: CANIDAE (Foxes, Wolves, and Relatives)	
Coyote (*Canis latrans*)	s
Red Fox (*Vulpes fulva*)	o
FAMILY: MUSTELIDAE (Weasels, Badgers, and Relatives)	
Long-tailed Weasel (*Mustela frenata*)	o
Striped Skunk (*Mephitis mephitis*)	o
FAMILY: CERVIDAE	
Elk (*Cervus elaphus*)	o
Colombian Black-tailed Deer (*Odocoileus hemionus columbarius*)	o



PLANT COMMUNITY TYPES

AG	Agricultural Fields
NNG	Non-native Grassland
NG	Native Grassland
CBS	Coyote Brush Scrub
WR	Willow Riparian Woodland
RUD	Ruderal Grassland
FWM	Freshwater Marsh
HR	Herbaceous Riparian
OW	Oak Woodland
LT	Landscape Trees (eucalyptus and others)
WM	Wet Meadow
POND	Pond with Open Water

Subject: PHASE I AND LIMITED PHASE II ENVIRONMENTAL SITE ASSESSMENT AND GEOHAZARDS STUDY REPORT
BORONDA ROAD FUTURE GROWTH AREA
CENTRAL AREA SPECIFIC PLAN
SALINAS, CALIFORNIA

Dear Mr. Ritchie:

At your request, we have performed a California Environmental Quality Act (CEQA)-level Phase I and Limited Phase II Environmental Site Assessment (ESA) and Geohazards Study for inclusion in the Environmental Impact Report for the Central Area Specific Plan (CASP) portion of the Boronda Road Future Growth Area project in Salinas, California. The CASP Site encompasses 760.4 acres of rural agricultural property bounded by E. Boronda Road to the south, Natividad Road to the west, agricultural land to the north, and Old Stage Road to the east.

The CASP Site consists of cultivated agricultural fields (strawberries, lettuce, raspberries, broccoli, etc.), existing and former rural residential structures and associated outbuildings, agricultural operation buildings and equipment storage yards, and fallow fields. The agricultural operations include the storage and use of fertilizers, pesticides, and fuel and oil. Due to the long-term use of the CASP Site for agricultural purposes, the Limited Phase II ESA was completed to provide preliminary information regarding the potential for persistent organochlorine pesticides and associated arsenic in surface soil.

We appreciate the opportunity to have performed this study for De Novo Planning Group. Please contact us if you have any questions concerning this report or if we may be of further service.

Sincerely,

GEOCON CONSULTANTS, INC.

John E. Juhrend, PE, CEG
Senior Engineer

Jim Brake, PG
Senior Geologist

PHASE I AND LIMITED PHASE II ENVIRONMENTAL SITE ASSESSMENT AND GEOHAZARDS STUDY REPORT – CENTRAL AREA SPECIFIC PLAN Page

PHASE I AND LIMITED PHASE II ENVIRONMENTAL SITE ASSESSMENT AND GEOHAZARDS STUDY REPORT – CENTRAL AREA SPECIFIC PLAN

1.0 INTRODUCTION

This report summarizes the methodology and presents the findings of a California Environmental Quality Act (CEQA)-level Phase I and Limited Phase II Environmental Site Assessment (ESA) for the Central Area Specific Plan (CASP Site) portion of the Boronda Road Future Growth Area project in Salinas, California. We performed the Phase I and Limited Phase II ESA and Geohazards Study for the De Novo Planning Group (the Client) to provide information for inclusion into the CEQA document being prepared by the Client for the City of Salinas.

1.1 Purpose and Objectives

The purpose of the Phase I ESA was to identify evidence or indications of ‘recognized environmental conditions’ (REC) as defined by the American Society for Testing and Materials (ASTM) *Designation E 1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.* Section 1.1.1 of ASTM *Designation E 1527-13* defines an REC as “the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.” De minimis conditions are those that generally do not present a threat to human health or the environment and that generally would not be the subject of the enforcement action if brought to the attention of appropriate governmental agencies.

ASTM *Designation E1527-13* also defines ‘Historical’ and ‘Controlled’ RECs. An ‘Historical REC’ is defined as “a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).” A ‘Controlled REC’ is defined as “a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).” An HREC is not a REC if the property meets current standards for unrestricted residential use. A CREC remains a REC by definition because the property does not meet the unrestricted residential use requirement unconditionally.

The Phase I ESA was also conducted in general accordance with the requirements of 40 Code of Federal Regulations (CFR) Part 312 titled *Standards and Practices for All Appropriate Inquiries,* as required under Sections 101(35)(B)(ii) and (iii) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The purpose of conducting an all appropriate inquiries investigation into the previous ownership and uses of a property is to meet the provisions necessary for the landowner, contiguous property owner, and/or bona fide prospective purchaser to qualify for certain landowner liability protections under CERCLA.

The following principles are an integral part of ASTM Designation E1527-13:

***"Uncertainty Not Eliminated* -** No environmental site assessment can wholly eliminate uncertainty regarding the potential for recognized environmental conditions in connection with a property. Performance of this practice is intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with a property, and this practice recognizes reasonable limits of time and cost."

***"Not Exhaustive* -** All Appropriate Inquiries does not mean an exhaustive assessment of a property. There is a point at which the cost of information obtained or the time required to gather it outweighs the usefulness of the information and, in fact, may be a material detriment to the orderly completion of transactions. One of the purposes of this practice is to identify a balance between the competing goals of limiting the costs and time demands inherent in performing an environmental site assessment and the reduction of uncertainty about unknown conditions resulting from additional information."

"Level of Inquiry is Variable – Not every property will warrant the same level of assessment. Consistent with good commercial and customary practice, the appropriate level of environmental site assessment will be guided by the type of property subject to assessment, the expertise and risk tolerance of the user, and the information developed in the course of the inquiry."

1.2 Scope of Services

Our Proposal No. LS-14-238, dated December 4, 2014, describes the scope of services for the Phase I and Limited Phase II ESA and Geohazards Study. The scope of services outlined in the proposal was performed with the exception that Sanborn Maps were not reviewed. Environmental Data Resources, Inc. (EDR) stated that Sanborn Map coverage does not exist for the CASP Site.

The main components of the Phase I ESA and their objectives, as specified by the referenced standards, include the following:

- **Physical Setting:** We reviewed physical setting references to obtain information concerning the topographic, geologic, and hydrogeologic characteristics of the CASP Site and vicinity. Such information may be indicative of the direction and/or extent that a contaminant could migrate in the event of a spill or release.
- **Records Review:** We reviewed publicly available Federal, State, and local regulatory agency records to obtain information that could potentially help identify RECs at or potentially affecting the CASP Site.

- **Site History:** We reviewed historical references to assess the history of previous uses of the CASP Site and surrounding area to identify those that could have led to RECs on or near the CASP Site. Historical sources reviewed included aerial photographs, topographic maps, city directories, and previous site assessment reports. In addition, we conducted interviews with persons who were expected to be reasonably knowledgeable about historical and/or current conditions at and uses of the CASP Site.
- **Site Reconnaissance:** We performed a site reconnaissance to observe site conditions and activities for indications of evidence of RECs. The site reconnaissance was for the CASP Site only. Offsite properties and features were viewed solely from the vantage of the CASP Site and public thoroughfares.

1.3 Report Limitations

The Phase I and Limited Phase II ESA and Geohazards Study report has been prepared exclusively for the Client and City of Salinas. The information obtained is only relevant for the dates of the records reviewed or as of the date of the latest site visit. Therefore, the information contained herein is only valid as of the date of the report and will require an update to reflect recent records/site visits.

The Client should recognize that this report is not a comprehensive site characterization and should not be construed as such. The findings and conclusions presented in this report are predicated on the site reconnaissance, a review of the specified regulatory records, and a review of the historical usage of the CASP Site, as presented in this report. The Client, should also understand that wetlands, asbestos-containing building materials, lead-containing paint, lead in drinking water, radon, mercury related to mining activities, methane, and mold surveys were not included in the scope of services for the Phase I ESA.

Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee or warranty of the results of the report is implied within the intent of this report or any subsequent reports, correspondence or consultation, either express or implied. We strived to conduct the services summarized herein in accordance with the local standard of care in the geographic region at the time the services were rendered.

1.4 Data Gaps

A data gap is defined by ASTM *Designation E 1527-13* as “a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information.” Data gaps could include such things as insufficient historical information, the inability to interview persons with direct site knowledge (e.g., the owner(s), past owner(s), tenants, workers, etc.) or the lack of access to all parts of a site during the site reconnaissance.

We were not provided access to three northwestern site parcels (Avila and Settrini) nor were we provided access to the interior of structures on the Christensen parcels. The lack of access inhibited our ability to adequately assess the environmental conditions of these Site parcels.

Additionally, Sanborn Maps were not reviewed for the CASP Site since EDR stated that Sanborn Map coverage was not available. However, based on our review of historical information from other sources, we do not consider the lack of Sanborn map coverage a data gap.

2.0 SITE DESCRIPTION

This section provides information regarding the location and physical characteristics of the CASP Site including its size, topography, geologic, soil, and hydrogeologic conditions.

2.1 Location and Legal Description

The CASP Site encompasses 760.4-acres of relatively flat to gently sloping land bounded by E. Boronda Road to the south, Natividad Road to the west, agricultural land to the north and Old Stage Road and agricultural land to the east (Figure 1). The CASP Site is depicted on United States Geological Survey's (USGS), 7.5-minute topographic map, Natividad, California (USGS, 1984). The CASP Site includes the northwestern quarter of Section 15, the central portion of Section 14, the southeastern corner of Section 13, and the northwestern corner of Section 23 of Township 14 South, Range 3 East, Mount Diablo Base and Meridian.

The CASP Site is further identified by the following Monterey County Assessor's Parcel Numbers (APNs): 153-091-001, 153-091-005, 211-013-007, 211-013-003, 211-013-008, 211-013-004, 153-091-006, 153-091-003, 153-091-007, 153-091-008, 153-091-009, 153-091-010, 153-071-034, 153-071-035, 153-101-005, 153-071-036, and 153-071-011. Parcel maps depicting the CASP Site are in Appendix A.

The following addresses are associated with the CASP Site:

APN 153-091-005 - 220 Natividad Road

APN 153-091-001 - 254 Natividad Road

APN 211-013-007 - 256 Natividad Road

APN 153-091-003 - 21025 E. Boronda Road

APN 153-071-034 - 21621 E. Boronda Road

APN 153-071-035 - 21673 E. Boronda Road

APN 153-101-005 - 801 Williams Road

2.2 Site and Vicinity General Characteristics

The CASP Site consists of 17 parcels that are predominantly agricultural land with some rural residential structures and associated outbuildings, agricultural operation buildings and equipment storage yards, and fallow fields. The CASP Site is situated along the northern edge of suburban development in Salinas including residential subdivisions and a high school south of E. Boronda Road. Similar agricultural land is generally present west , north and east of the CASP Site with grazing land to the north east beyond Old Stage Road (Figure 2).

2.2.1 Topography

The overall topographic relief of the CASP Site is approximately 76 feet, with a maximum elevation of approximately 146 feet above mean sea level (MSL) at the northeastern boundary to a minimum elevation of approximately 70 feet above MSL where Natividad Creek crosses beneath E. Boronda Road. The overall slope across the CASP Site is from north to south at approximately 0.3%. An approximate 20- to 25-foot-high slope trends north-south across the central portion of the CASP Site separating natural river terraces. Gabilan Creek flows in a north to south direction through the western portion of the CASP Site and Natividad Creek flows in a north to south direction through the eastern portion.

2.2.2 Geologic and Soil Conditions

Geologic information was obtained from the *Geologic Map of the Monterey Quadrangle* (California Geological Survey [CGS], 2002). The CASP Site is located in the southern Salinas Valley in the Coast Ranges geomorphic province. The valley is bounded by the Gabilan Range to the east, the Sierra de Salinas Mountains to the south and west, and by Monterey Bay to the northwest. The northern Salinas Valley is filled with a thick sequence of Pleistocene to recent age sedimentary deposits both continental and marine in origin. The referenced geologic map indicates that the CASP Site is underlain by Quaternary alluvial fan deposits and floodplain deposits (CGS, 2002).

2.2.3 Soil Conditions

We obtained information regarding soil conditions in proximity to the CASP Site from the United States Department of Agriculture's (USDA) Web Soil Survey (http://websoilsurvey.nrcs.usda.gov/app/HomePage.htm). Information available on Web Soil Survey indicates that surficial onsite soil is predominantly classified as Chualar loam and Placentia sandy loam, which are well-drained alluvial soil derived from igneous and metamorphic rock.

2.3 Geologic Hazards

2.3.1 Surface Fault Rupture

Numerous active, potentially active, and inactive faults are present in Central California. The criteria for classification of these faults were developed by the CGS for the Alquist-Priolo Earthquake Fault

Zone (APEFZ) Program. By definition, an active fault is one that has had surface displacement within the last 11,000 years. A potentially active fault has demonstrated surface displacement during Quaternary time (approximately the last 1.6 million years), but has had no known movement within the past 11,000 years. Faults that have no demonstrated surface displacement in the last 1.6 million years are considered inactive.

Regional faults in proximity to the CASP Site are depicted on Figure 3. The CASP Site is not located within a currently established APEFZ. Based on published geologic maps and reports, no active or potentially active faults with the potential for surface fault rupture are known to pass directly beneath the CASP Site. Therefore, the potential for surface rupture due to faulting occurring beneath the CASP Site during the design life of the proposed project is considered low. The CASP Site, however, is located in a seismically active area and could be subjected to ground shaking in the event of an earthquake on one of the many active Central California Coast Range faults.The following table lists regional faults within 60 miles of the CASP Site, their distances, and maximum earthquake magnitudes for each.

REGIONAL FAULT SUMMARY

Fault Name	Approximate Distance from CASP Site (miles)	Maximum Earthquake Magnitude
Zayante-Vergeles	6.5	6.8
Rinconada	7.6	7.3
San Andreas (1906)	9.3	7.9
San Andreas (Pajaro)	9.3	6.8
San Andreas (Creeping)	9.3	6.5
Sargent	13.9	6.8
Calaveras (South of Calaveras Reservoir)	14.1	6.2
Monterey Bay – Tularcitos	16.6	7.1
San Andreas (Santa Cruz Mtns.)	16.9	7.0
Quien Sabe	19.5	6.4
Palo Colorado – Sur	25.0	7.0
San Gregorio	29.6	7.3
Monte Vista – Shannon	34.1	6.8
Ortigalista	35.2	6.9
Great Valley 8	37.3	6.6
Great Valley 9	37.5	6.6
San Andreas (Peninsula)	38.3	7.1
Hayward (SE Extension)	38.8	6.4
Hosgri	40.0	7.3
Great Valley 10	42.1	6.4
Greenville	48.9	6.9
Great Valley 11	50.1	6.4
Great Valley 7	51.0	6.7
Calaveras (No. of Calaveras Res)	51.3	6.8
Hayward (South)	51.3	6.9
Hayward (Total Length)	51.3	7.1

2.3.2 Seismicity

The CASP Site is located within the seismically active Monterey Bay area. Based on available reports published by CGS and the USGS, the CASP Site has not experienced reported ground failure as a result of past earthquakes.

2.3.3 Liquefaction

Liquefaction is a phenomenon in which loose, saturated, cohesionless soil deposits located beneath the groundwater table lose strength when subjected to intense and prolonged ground shaking. The seismic excitation increases pore water pressure creating a buoyant effect of the loose soil. When liquefaction occurs, building foundations may sink or tilt and differential ground settlement may occur. Other effects include sand boils (ground loss) and lateral spreading if the liquefiable soil is located adjacent to a steep free face. The areas that have the greatest potential for liquefaction are those in which the water table is less than 50 feet below ground surface and the soils are predominately clean, poorly graded sand deposits of loose to medium-dense relative density.

The CASP Site is not located in a currently established State of California Seismic Hazard Zone for liquefaction. However, soil and groundwater conditions may exist at the CASP Site that may be susceptible to seismic-induced liquefaction.

2.3.4 Lateral Spreading

Seismic-induced lateral spreading is not a likely hazard for the CASP Site because the site topography is generally flat-lying.

2.3.5 Unsaturated Seismic Settlement

Strong seismic shaking can induce settlement of unsaturated, loose sandy soil. Soil conditions may exist at the CASP Site that may be susceptible to unsaturated seismic settlement.

2.3.6 Landslides and Slope Stability

The topography of the CASP Site and vicinity is relatively flat lying. Based on the observed site topography, we do not consider landslides or slope instability to be a hazard for the CASP Site.

2.3.7 Tsunamis and Seiches

The CASP Site is located approximately 10 miles east of the Pacific Ocean at elevations ranging from approximately 70 to 146 feet above MSL. The CASP Site is not within a Tsunami Inundation Area; these areas are mapped by the California Emergency Management Agency and the CGS for coastal areas in California. In the Monterey Bay Area, the elevation of the tsunami inundation line (i.e., maximum anticipated limit of tsunami) is at an approximate elevation of 10 feet above MSL. Given elevations above the anticipated limit of tsunamis in the area, tsunamis (seismic sea waves) or seiches (wave oscillations in an enclosed or semi-enclosed body of water) are not anticipated hazards for the CASP Site.

2.3.8 Flooding and Dam Failure Inundation

Based on the Flood Insurance Rate Maps ([FIRM], Map Nos. 06053C0226G and 06053C0228G; effective date April 2, 2009) prepared by FEMA, the majority of the CASP Site is located in "Zone X" which is defined as: "Areas determined to be outside the 0.2 percent annual chance floodplain." The western portion of the CASP Site is located in a stippled Zone X: "Areas of 0.2 percent annual chance flood" and Zone AE: "Special Flood Hazard Area subject to flooding by the 1% annual chance flood", (FEMA, 2009). The eastern portion of the CASP Site is located in a stippled Zone A: "Special Flood Hazard Area subject to inundation by the 1% annual chance flood." The project civil engineer should determine site grades accordingly. The California Department of Water Resources does not map the CASP Site within a floodplain.

Regional topographic maps and aerial photography we reviewed indicate that the CASP Site is located approximately 35 miles from San Luis Reservoir with topographic separation provided by the Gabalon and Diablo Ranges eat of the Site. The California Governor's Office of Emergency Services *Dam Inundation Maps*, shows that the CASP Site is not appear to be located within the inundation zones of the reservoir. Therefore, dam failure inundation is not considered to be a hazard for the CASP Site.

2.3.9 Volcanic Activity

Volcanic activity closest to the CASP Site is persistent geothermal energy and long-period volcanic seismicity near Clear Lake, which is located approximately 164 miles to the northwest. The nearest active volcano to the Site is Mammoth Mountain, located approximately 157 miles to the northeast. Due to the large distances, the potential for impacts to the CASP Site due to regional volcanic activity is low.

2.3.10 Naturally Occurring Asbestos

The CASP Site is not located within or near an area mapped as an ultramafic rock unit. The nearest mapped ultramafic rocks are approximately 25 miles southeast of the Site and in a different watershed. Naturally occurring asbestos (NOA) minerals (chrysotile, tremolite, actinolite) are more likely to be encountered in areas with ultramafic or some metavolcanic rocks due to metamorphic processes. Based on the distance to the ultramafic rock outcrop, the likelihood of NOA being present at the CASP Site is considered to be low.

2.3.11 Oil Fields & Methane Zones

Based on the California Division of Oil, Gas and Geothermal Resources (DOGGR) online mapping system, the CASP Site is not located within the boundaries of an oil or gas field. No oil or gas wells are located within 5 miles of the CASP Site (DOGGR, 2017). However, due to the voluntary nature of record reporting by the oil and gas well drilling companies, wells may be improperly located or not shown on the location map. Unmapped wells could be encountered during construction would need to be properly abandoned in accordance with the current requirements of DOGGR. However, it is unlikely that unmapped wells are located on the CASP Site as there is not a history of oil or gas exploration in the Salinas Valley.

2.4 Hydrologic and Hydrogeologic Conditions

To assess local groundwater conditions we reviewed reports available on the California State Water Resources Control Board (SWRCB) GeoTracker website (http://geotracker.waterboards.ca.gov) for groundwater information at nearby facilities with a groundwater monitoring array such as leaking underground storage tank (LUST) facilities or other agency-regulated cleanup sites. The nearest such facility is the Shell Station at 1764 North Main Street, approximately 1.5 miles west of the CASP Site. According to information available on GeoTracker for this facility, depth to groundwater measured in shallow groundwater monitoring wells at this facility ranged from approximately 50 to 55 feet in November 2016. Shallow groundwater beneath this facility was determined to flow to the south to southeast.

2.5 Current and Planned Uses of the CASP Site

The majority of the CASP Site is utilized for agriculture purposes. The CASP Site is proposed for development as a master-planned community including residential neighborhoods supported by commercial uses, schools, and an extensive park and trail system. A copy of the CASP Site proposed development plan is in Appendix B.

2.6 Descriptions of Structures, Roads, Other Improvements on the CASP Site

The CASP Site contains a few structures including rural residential and agricultural-related buildings all within the western parcels west of Gabilan Creek. No structures are present on the central and eastern portions of the CASP Site. Evidence of former building improvements exist within APN 153-091-003 (former landscape nursery) and APN 153-071-035 (former dairy/residences) along E. Boronda Road.

Unpaved access roads are present on the majority of the CASP Site parcels. A paved driveway extending from E. Boronda Road and an associated parking lot are present on APN 153-091-003.

Other onsite improvements include several agricultural and domestic wells, and agricultural equipment storage yards. Electrical transmission towers extend south to north then west to east across the central portion of the CASP Site. A fenced electrical compound (former substation) containing electrical transmission towers and abandoned concrete foundations is located along the southern boundary of APN 211-013-004 in the northern portion of the CASP Site.

2.7 Current Uses of Adjoining Properties

The area north of the CASP Site consists of similar agricultural land and rural residences. Land east and west of the CASP Site are also designated as part of the Future Growth Area (the Eastern and Western Area Specific Plans) in the Salinas General Plan. These properties are currently used for grazing and agricultural production. South of the CASP Site across E. Boronda Road are residential subdivision developments and Everett Alvarez High School.

3.0 RECORDS REVIEW

This section summarizes readily available agency records for the CASP Site and properties and facilities in the surrounding vicinity.

3.1 CASP Site Specific Plan Appendix Documents

The following CASP Site Specific Plan Appendix documents provided by Mr. Hugh with Thrust IV Management Services (CASP Site development team representative) were reviewed:

1. *Phase I Environmental Site Assessment and Limited Phase II Soil Testing, Christensen Parcels, Boronda and Natividad Roads, Salinas, California,* Earth Systems Pacific, October 2007.
2. *Phase I Environmental Site Assessment and Limited Phase II Soil Investigation, Matsui/Codiroli Properties, 600 Acres Northeast of Boronda Rd. at Hemmingway Dr., Salinas, Monterey County, California,* Earth Systems Consultants, February 2001.
3. *Additional Deeper Soil Sampling and Testing, Matsui Codiroli Properties, Salinas, California,* Earth Systems Consultants, March 2001.
4. *Phase I Environmental Site Assessment, Proposed New School Site, Probert/Matsui Property, North of East Boronda Road, Salinas, California,* Kleinfelder, January 2009.
5. *Geologic and Seismic Hazards Assessment Report, Proposed New SUHSD Middle School Campus, North of E. Boronda Road, Salinas, California,* Kleinfelder, January 2013.

<u>Christensen Parcels Phase I and II ESA (Reference #1)</u> - this 2007 ESA report was prepared by Earth Systems Pacific for the two Christensen parcels (APNs 153-091-001 and -005) located on the western portion of the CASP Site. Potential environmental concerns identified at the Christensen parcels included residual pesticides in surface soil, three aboveground and one underground fuel storage tanks, ponded oil beneath a ranch building, and several 55-gallon drums and 5-gallon buckets containing waste oil at the ranch compound buildings. The limited Phase II ESA included collection of 15 surface soil samples within the agricultural fields for analysis of pesticides and five shallow soil samples at the aboveground storage tanks (ASTs) and waste oil storage areas for analysis of petroleum hydrocarbons. With the exception of dieldrin, the reported pesticide concentrations were less than the referenced regulatory residential screening levels. Four soil samples collected from the southern portion of the parcels contained dieldrin concentrations slightly exceeding the residential screening level. An elevated diesel concentration was detected in a surface soil sample obtained adjacent to the AST located next to the gasoline underground storage tank (UST). Earth Systems Pacific recommended additional characterization of the extent of dieldrin in the southern portion of the parcels, proper removal of the fuel ASTs and UST, disposal of petroleum hydrocarbon-impacted soil and waste oil containers, and proper abandonment of unused onsite wells.

<u>Matsui/Codiroli Parcels Phase I and II ESA (Reference #2)</u> - this 2001 ESA report was prepared by Earth Systems Consultants for the Matsui/Codiroli parcels (APNs 153-091-006, -007, -008, -009 and -010) comprising the central and eastern portions of the CASP Site. Potential environmental concerns identified at the Matsui/Codiroli parcels included residual pesticides in surface soil, and four fuel ASTs, three with visible surface staining. The limited Phase II ESA included collection of 25 surface soil samples within the agricultural fields for analysis of pesticides, lead and arsenic and one surface soil sample obtained adjacent to the western diesel AST for analysis of petroleum hydrocarbons. With the exception of dieldrin and toxaphene, the reported pesticide, lead and arsenic concentrations were less than the referenced regulatory residential screening or background levels for arsenic. Several soil samples contained dieldrin and/or toxaphene concentrations exceeding the regulatory residential screening level. Elevated diesel and motor oil concentrations were reported for the surface soil sample obtained adjacent to the diesel AST. Earth Systems Consultants recommended of a health risk assessment for the elevated pesticide concentrations in surface soil, removal and proper disposal of petroleum hydrocarbon-impacted soil at the western diesel AST, proper disposal of waste oil containers, and proper abandonment of unused onsite wells.

<u>Matsui/Codiroli Parcels Additional Soil Pesticide Characterization (Reference #3)</u> - this 2001 letter report was prepared by Earth Systems Consultants for the Matsui/Codiroli parcels (APNs 153-091-006, -007, -008, -009 and -010) comprising the central and eastern portions of the CASP Site. Six deeper soil samples (18 inches) were collected at locations throughout the parcels and analyzed for chlorinated pesticides. Pesticides were not detected at concentrations exceeding the laboratory reporting limits for each soil sample analyzed.

<u>Proposed School Site Phase I ESA (Reference #4)</u> - this 2009 Phase I ESA was performed by Kleinfelder for a proposed public school on portions of APNs 153-091-006 and -007 in the central portion of the CASP Site. The property was noted to be utilized for agricultural purposes since at least the 1950s. Kleinfelder recommended a soil investigation to evaluate potential shallow soil pesticide impacts and pole-mounted transformer leaks, and disposal of a 5-gallon container of hydraulic fluid.

<u>Proposed School Site Geohazard Study (Reference #5)</u> - this 2013 geohazard study was performed by Kleinfelder for the proposed public school on portions of APNs 153-091-006 and -007 in the central portion of the CASP Site. Soil conditions were described as alluvial fan deposits consisting of weakly consolidated, moderately to poorly sorted sand, silt, and gravel. Regional depth to groundwater was reported as being in excess of 50 feet based on information from nearby borings completed in 2005 and 2012. Kleinfelder concluded that the property was suitable for public school construction provided a site-specific geotechnical engineering investigation was completed.

Excerpts of the Phase II ESA reports including site plans depicting the sampling locations and associated soil analytical data summary tables are in Appendix C.

3.2 Standard Environmental Record Sources

EDR searched of Federal, State, and local databases for the CASP Site and properties/facilities in the surrounding area within one mile of the CASP Site. A copy of the report titled *The EDR Radius Map Report with GeoCheck*, dated March 24, 2017, is in Appendix D. The following table lists databases that were searched and the number of listings.

Database Name	Search Radius (Miles)	Number of Listings
FEDERAL DATABASES		
ERNS (Emergency Response Notification System)	0.125	1
STATE, LOCAL, AND TRIBAL DATABASES		
ENVIROSTOR (DTSC Electronic Database)	1.125	3
AST (Aboveground Storage Tank)	0.375	2
ADDITIONAL ENVIRONMENTAL RECORDS		
SCH (School Property Evaluation Program)	0.375	1
SWEEPS UST	0.375	2
HIST UST	0.375	3
CA FID UST (Facility Inventory Database [FID])	0.375	2
Certified Uniformed Program Agency (CUPA)	0.375	6
HAZNET (Facility and Manifest Data)	0.125	2

3.2.1 CASP Site

One onsite property is listed in the databases searched by EDR. The Settrini Ranch located at 250 Natividad Road, in the northwestern portion of the CASP Site, is listed in the HIST UST, SWEEPS UST, CA FID UST, and CUPA Listing databases. The databases list an active 1,000-gallon gasoline underground storage tank (UST). According to the CUPA Listing database, this facility is actively regulated by Monterey County for agricultural-related hazardous materials storage. The existing or former presence of a gasoline UST on this site parcel is a potential REC for the CASP Site.

The EDR Orphan Summary identifies facilities that have incomplete address information and could not be specifically plotted. The Orphan Summary lists the following three onsite properties that were investigated under the oversight of the California Department of Toxics Substance Control (DTSC) for development of public school facilities:

- Elementary School #12 (Creekbridge) – E. Boronda and Hemmingway
- Creekbridge Middle School – E. Boronda and Hemmingway
- Proposed Elementary School #5 Harrod - Northeast of E. Boronda and Natividad

Due to past and current agricultural use, each onsite property was investigated for past pesticide use and other potential contaminants of concern. For each property DTSC issued regulatory “no further action” status and granted approval for school site construction. Additional details regarding environmental investigations completed at each of these onsite properties are in Section 3.3.1.

3.2.2 Offsite Properties

The following table summarizes information regarding properties located within ¼-mile of the CASP Site that are listed on one or more of the databases searched by EDR. The summary includes the status of the listings, and the potential, if any, to impact (or to have impacted) the CASP Site.

Business	Address	Approximate Distance from the CASP Site	Database	Pertinent Information/Potential to Impact the Site
Steve and Carol Silva	804 Old Stage Road	Adjacent and north (upgradient)	HAZNET	This property is listed for disposal of 0.4 tons of pesticide waste at a transfer station. Based on the lack or reported spills or releases, this property appears unlikely to have caused an REC at the CASP Site.
Bob Swanson	808 Old Stage Road	Adjacent and north (upgradient)	HAZNET	This property is listed for disposal of 1.68 tons of asbestos-containing waste at a landfill. Based on the lack or reported spills or releases, this property appears unlikely to have caused an REC at the CASP Site.
Triangle Farms, Inc.-Bondesen Ranch	239 Natividad Road	Adjacent and west (cross-gradient)	AST, CUPA Listings	This facility is listed for a 9,200-gallon petroleum AST. According to the CUPA Listings database, this facility is regulated by Monterey County for agricultural-related hazardous material and waste storage. Based on the lack or reported releases or violations, and its cross-gradient location, this facility appears unlikely to have caused an REC at the CASP Site.
Salinas Berry Farms-Madolora	261 Natividad Road	Adjacent and west (cross-gradient)	CUPA Listings	This facility was regulated by Monterey County for agricultural-related hazardous material storage. This facility is listed as inactive. Based on the lack of reported releases or violations, and downgradient location, this former facility is unlikely to have caused an REC at the CASP Site.

The EDR Orphan Summary lists three offsite properties that were investigated under the oversight of the DTSC for development of public school facilities and one offsite property under the Clandestine Drug Lab database. Based on the type of regulatory database listings, these properties do not appear to have caused an REC at the CASP Site.

3.3 Other Environmental Record Sources

3.3.1 GeoTracker and EnviroStor

We reviewed GeoTracker and the DTSC EnviroStor (http://www.envirostor.dtsc.ca.gov/ public/) website databases for information regarding any environmental assessment, cleanup and regulatory program listings at the CASP Site parcels. The following onsite addresses are identified on GeoTracker under the Irrigated Lands Regulatory Program:

- Fernandez Brothers, Naturipe Berry Growers, Classic Farms - 250 Natividad Road
- Bay View Farms, Pacific Berry Farms, Berry Valley Braz - Natividad Road
- Triangle Farms, Inc., Christensen - 222 Natividad Road
- Classic Farms, Cordiroli Ranch – E. Boronda Road
- T-T Miyasaska Ranch, Settrini Cordiroli Ranch – E. Boronda Road

No environmental concerns are anticipated at the CASP Site parcels based on the nature of the Irrigated Lands Regulatory Program database.

Information available on the DTSC's EnviroStor website regarding environmental investigations completed for proposed public school sites within the CASP Site is summarized below:

Proposed School Site, APNs 153-091-001 and -005 - a Preliminary Environmental Assessment (PEA) report was prepared by LFR in March 2010 for a proposed school site on APNs 153-091-001 and -005 on the western portion of the CASP Site. The potential presence of persistent pesticides (and associated arsenic) was the only environmental concern identified within the proposed school site. Twenty-nine surface soil samples were collected within the agricultural field for analysis of arsenic and organochlorine pesticides. The reported arsenic and pesticide concentrations were determined to be within the acceptable risk management range. The DTSC provided a "no further action" determination and granted approval from a potential contamination assessment perspective to construct the school site.

Proposed School Site, APN 153-091-006 - a PEA report was prepared by LFR in April 2010 for a proposed school site on APN 153-091-006 on the central portion of the CASP Site. Potential environmental concerns identified at the proposed school site included agricultural-related pesticides, lead-containing associated with a historical wooden structure, and former and current fuel ASTs. Based on the results of an investigation of a nearby proposed school site (Rogge Property), an evaluation of the potential presence of NOA was determined not to be necessary. Other than the reported presence of elevated petroleum hydrocarbons in shallow soil adjacent to a diesel AST, the identified chemicals of concern were reported at concentrations within the acceptable risk management range. A "housekeeping" cleanup was completed at the diesel AST including the removal and disposal of approximately 10 tons of petroleum-hydrocarbon impacted soil. The DTSC provided a "no further action" determination and granted approval from a potential contamination assessment perspective to construct the school site.

Proposed School Site, APNs 153-091-006 and -007 - a PEA report was prepared by Kleinfelder in May 2010 for a proposed school site on APNs 153-091-006 and -007 on the central portion of the CASP Site. Potential environmental concerns identified at the proposed school site included agricultural-related pesticides, polychlorinated biphenyls (PCBs) associated with pole-mounted transformers, and sampling of shallow soil and groundwater at the onsite agricultural well. The identified chemicals of concern were reported at concentrations within the acceptable risk management range. The DTSC provided a "no further action" determination and granted approval from a potential contamination assessment perspective to construct the school site.

Excerpts of the PEA reports including site plans depicting sample locations and associated soil analytical data summary tables are in Appendix C.

3.3.2 County of Monterey Environmental Health

We requested a records search for the site parcels and addresses with the County of Monterey Environmental Health Department (CMEHD) and have not received a response as of the date of this report. Based on our review of the CASP Site and information provided by the EDR reports, we do not anticipate that CMEHD has documents relating to hazardous materials for the CASP Site. However, if documents are provided that change our findings of this report, they will be provided in an addendum letter.

3.3.3 County of Monterey Resource Management Agency

We requested building permit records for the CASP Site from the Monterey County Resources Management Agency and have not received a response as of the date of this report.

3.3.4 Monterey Bay Unified Air Pollution Control District

We requested records from the Monterey Bay Unified Air Pollution Control District (MBUAPCD) for the CASP Site. The MBUAPCD identified one record for APN 153-071-034 with an address of 21621 E. Boronda Road. The parcel owner (Creekbridge Homes) obtained a permit in 2006 to demolish twelve buildings at the parcel (Chuna Ranch) including the abatement of 120 square feet of regulated asbestos containing building materials.

3.3.5 Petroleum Pipelines

We researched online databases to provide an indication whether crude oil and/or petroleum product pipelines were located at the CASP Site. The sources researched were:

- National Pipeline Mapping System gas transmission and hazardous liquid map (https://www.npms.phmsa.dot.gov/PublicViewer/composite.jsf)
- California Office of the State Fire Marshall crude oil pipelines map (http://osfm.fire.ca.gov/pipeline/pdf/Crude20130110.pdf)

- Kinder Morgan products system map (http://www.kindermorgan.com/pages/asset_map/default.aspx)

No petroleum pipelines were depicted beneath the CASP Site on the maps.

4.0 HISTORICAL USE

Historical use of the CASP Site and adjacent properties was evaluated through review of historical aerial photographs, historical topographic maps, and city directories provided by EDR. This section summarizes the information obtained from these sources.

4.1 Aerial Photographs

We reviewed historical aerial photographs for the years 1956, 1968, 1971, 1981, 1987, 1998, 2005, 2009, 2010, and 2012 (Appendix E) for indications of past land uses that had the potential to have impacted the CASP Site through the use, storage or disposal of hazardous substances and/or petroleum. The following table summarizes observations of the CASP Site and adjacent properties on the aerial photographs.

Year	Observations	
	CASP Site	**Adjacent Properties**
1956-1987 (1” = 1,000’)	Agricultural fields (row crops) were present on the majority of the CASP Site. Three residential/agricultural building areas were in the western portion of the CASP Site and another cluster of agricultural-related buildings were in the southeastern portion (most not present in 1987 photo). Transmission towers are visible across the central portion of the CASP Site with an associated substation at the north-central portion of the CASP Site.	Agricultural fields and related rural residential and farm buildings were on adjacent properties.
1998 (1” = 500’)	Conditions were similar to those observed on the 1987 photograph with the exception of onsite residential structures on the southern portion of the CASP Site.	Conditions were similar to those observed on the 1987 photograph with the exception of residential subdivision development and a high school south of E. Boronda Road.
2005, 2009, 2010 and 2012 (1” = 500’)	Conditions were similar to those observed on the 1998 photograph with the exception of commercial development on the southwestern portion of the CASP Site north of the high school.	Conditions were similar to those observed on the 2005 photograph.

Row crops were present on the CASP Site from at least 1956 to the present. The agricultural use of the CASP Site dating back to at least 1956 suggests that persistent organochlorine pesticides (OCPs) and associated elevated arsenic concentrations exceeding residential screaming levels (for OLPs) naturally occurring background levels (for arsenic) may be present in shallow soil. No other land uses that would suggest the presence of RECs were observed on the CASP Site or adjacent properties in the aerial photographs.

4.2 Topographic Maps

We reviewed historical topographic maps for the years 1910, 1912, 1940, 1947, 1950, 1968, and 1984 (Appendix F). The following table summarizes the observations of the CASP Site and adjacent properties on the historical topographic maps.

Year	Observations	
	CASP Site	**Adjacent and Vicinity Properties**
1910 (1: 31,680)	Gabilan and Natividad Creeks are depicted on the CASP Site. One or two rural residential structures and an unimproved road are depicted in the northwestern portion of the CASP Site.	Natividad Road and Old Stage Roads in addition to unimproved roads are depicted adjacent to the CASP Site. Natividad is depicted north of the eastern portion of the CASP Site.
1912 (1: 62,500)	Similar to the 1910 map.	Similar to the 1910 map, Salinas depicted southwest of the CASP Site.
1940 (1: 62,500)	Additional structures are depicted on the western portion of the CASP Site and a transmission line across the central portion.	Similar to the 1912 map with additional development in Salinas.
1947 and 1950 (1:62,500, 1:24,000, and 1:25,000)	An electrical substation is depicted along the north-central portion of the CASP Site. Additional agricultural-related structures are depicted on the western and southeastern portions of the CASP Site in addition to unimproved roads.	Similar to the 1940 map.
1968 and 1984 (1:24,000)	Similar to the 1950 map with an additional residential structure on the western portion of the CASP Site.	Similar to the 1950 map with residential development southeast of the intersection of Natividad and E. Boronda Roads.

The topographic maps do not depict any other land uses that would suggest the presence of RECs on the CASP Site or adjacent properties.

4.3 City Directories

EDR prepared an abstract of city directories including city, cross reference and telephone directory listings (Appendix G). EDR included information from directories at approximate five-year intervals, if available, from 1960 to 2013. The following CASP Site parcel addresses are listed with the following ownership/tenants:

- 2003 and 2008: 21025 E. Boronda Road - Thrust IV
- 1995 and 2003: 21621 E. Boronda Road - Johnny Cunha, and Mary Cunha
- 1995 and 2003: 21673 E. Boronda Road – Jose Chavez, FR Yanez, Gloria Zamora, Gracey Serrato, Inocencia Martinez, and Teresa Salazar

None of the listings suggest the storage or use of hazardous substances or petroleum on the CASP Site.

5.0 SITE RECONNAISSANCE

This section summarizes observations of the CASP Site and surrounding properties made during the site reconnaissance.

5.1 Methodology and Limiting Conditions

John Juhrend, Senior Engineer with Geocon, performed a site reconnaissance on April 20, 2017. Mr. Juhrend met with Hugh Walker with Thrust IV who provided owner permission and access instructions for the CASP Site with the exception of APNs 211-013-003, -007 and -008. These parcels located in the northwestern portion of the CASP Site are not currently annexed into the City of Salinas and the parcel owners did not provide authorization to enter.

Mr. Juhrend performed the site reconnaissance by driving and walking to observe site features and conditions. The offsite survey was performed by making observations of adjacent properties from the CASP Site and public roads. Weather on the day of the site reconnaissance was clear with temperatures in the 70s°F. Photos of various site features and offsite properties are attached.

5.2 Site Setting

The CASP Site consists predominantly of agricultural land with residential and agricultural buildings on the western portion. Unimproved roads provide access to the onsite agricultural fields and structures. Pole-mounted electrical transformers were noted adjacent to several of the interior roads with no visible indicators of leakage.
The CASP Site is bordered by similar agricultural properties to the west (across Natividad Road) and north, undeveloped grazing land to the east across Old Stage Road, and residential subdivisions and a high school to the south across E. Boronda Road.

5.3 Onsite Survey

The following descriptions are based on observations of the 17 parcels that comprise the 760.4-acre CASP Site. Ownership names in parentheses were obtained from the CASP Site development plan (Appendix B).

5.3.1 APN 211-013-007 (Avila)

We were not granted permission to enter this 0.51-acre residential parcel located adjacent to Natividad Road.

5.3.2 APNs 211-013-003 and -008 (Settrini)

We were not granted permission to enter these two parcels totaling 84.6 acres in the northwestern portion of the CASP Site. An agricultural well and fertilizer tanks were observed at the southwestern corner of these parcels (Photo No. 1). The vast majority of these parcels consist of agricultural fields (strawberries). The central portion of the parcels contains two rural residences and agricultural-related buildings and equipment yard.

5.3.3 APNs 153-091-001 and -005 (Christensen)

These two parcels totaling 149.6 acres comprise the southwestern portion of the CASP Site. The vast majority of the parcels consist of agricultural fields (lettuce, raspberries and recently tilled), a ranch compound and newer rural residence (Photo Nos. 2 through 8). The ranch compound contains an older unoccupied residence and detached garage, and equipment buildings. Fertilizer ASTs, and fuel dispensers associated with a gasoline UST, and gasoline and diesel ASTs were observed on the eastern portion of the ranch compound. No significant surface staining was noted in these areas. Agricultural and domestic wells are located on these parcels.

5.3.4 APN 211-013-004 (Gladstone Farms)

This 25.39- acre parcel located on the north-central portion of the CASP Site consists of recently tilled and fallow agricultural fields. An agricultural well and a fenced former electrical substation and associated transmission towers are located on the southern portion of the parcel (Photo Nos. 9 and 10).

5.3.5 APN 153-091-006 (Probert and Codiroli)

This 214.62-acre parcel consists of agricultural fields (broccoli, recently tilled and fallow strawberries). An equipment yard located on the central western portion of the parcel contains a diesel AST with steel secondary containment on a concrete slab (Photo No. 11). Electrical transmission towers cross the western portion of this parcel (Photo No. 12).

5.3.6 APN 153-091-003 (Larry Noon)

This 9.0-acre undeveloped parcel is located on the southwestern portion of the CASP Site along E. Boronda Road and across from the high school. The parcel contains an asphalt-paved driveway and parking lot accessed from E. Boronda Road (Photo No. 13). The remainder of the parcel consists of overgrown fields containing inert debris piles, burned debris and evidence of former building improvements (landscape nursery).

5.3.7 APNs 153-071-011, -034, -035, and -036 (ATC Reality Sixteen LLC)

These parcels totaling 37.6 acres comprise the southeastern portion of the CASP Site. Parcels 153-071-034 and -035 contain evidence of former rural residential development including unpaved access drives, debris piles and a domestic well (Photo No. 14). The remainder of the parcels consists of fallow former agricultural fields (Photo No. 15).

5.3.8 APN 153-101-005 (Helmers)

This 19.34-acre parcel consists of fallow former agricultural fields.

5.3.9 APNs 153-091-007, -008, -009 and -010 (Matsui)

These parcels totaling 219.74 acres consist of agricultural fields (strawberries and broccoli) comprising the eastern portion of the CASP Site. Three agricultural equipment yards are located on the parcels (Photo No. 16). The central equipment yard contains fuel and oil ASTs and drums (Photo Nos. 17 and 18). Relatively minor surface staining was noted in these areas.

5.4 Offsite Survey

Adjacent properties consist of the following:

North: Similar agricultural fields and rural residential development (Photo No. 19).

East: Undeveloped grazing land northeast of Old Stage Road (Photo No. 20).

South: Residential subdivisions and high school south of E. Boronda Road (Photo No. 21).

West: Agricultural land west of Natividad Road (Photo No. 22).

No evidence of RECs was observed on the properties adjacent to CASP Site.

6.0 INTERVIEWS

We interviewed Bill Tarp who farms the western portion of the CASP Site including APNs 153-091-001 and -005 (western parcels). Mr. Tarp has been farming the western parcels since 2007 including strawberries, raspberries and lettuce. As far as Mr. Tarp knows, the western parcels were initially developed as a farm and has not had any other industrial or commercial uses. Mr. Tarp did confirm that APN 153-091-003 located adjacent and south of the western parcels was previously occupied by a landscape nursery for the Creekbridge master-planned community located south of E. Boronda Road. According to Mr. Tarp, the western parcels contain three agricultural wells and one domestic well. The ranch compound on APN 153-091-001 contains active fertilizer ASTs, and a gasoline UST and gasoline and diesel ASTs that are inactive. Current onsite refueling is performed using portable tanks. There is no known use of Transite™ or other asbestos-containing pipe at the western parcels; irrigation pipe is high-pressure plastic. There has been no unauthorized waste dumping at the western parcels. Mr. Tarp stated that registered pesticide application is performed by outside companies, including The Dune Company of Salinas and NH3 Services Company, Inc. Pesticides are not mixed at the western parcels. Mr. Tarp is not aware of any environmental liens, land use limitations, environmental regulatory actions or environmental cleanups at the western parcels.

We interviewed Pancho Torres who farms the central portion of the CASP Site consisting of parcel 153-091-006 (central parcel). Mr. Torres has been farming the central parcel since approximately 1984 for strawberries and other row crops. He did not recall any buildings present on the central parcel. Mr. Torres stated that the adjacent parcels to the south were previously operated as a dairy and all the buildings subsequently demolished. He recalled that transformers were located at the fenced electrical substation located on the adjacent parcel to the north. According to Mr. Torres, the central parcel contains two agricultural wells. No USTs are located on the central parcel. There is no known use of Transite™ or other asbestos-containing pipe at the western parcels; irrigation pipe is plastic. There has been no unauthorized waste dumping at the central parcel. Mr. Torres stated that pesticide application is performed using spray tractors. Mr. Torres is not aware of any environmental liens, land use limitations, environmental regulatory actions or environmental cleanups at the central parcel.

We also interviewed Adrian Mendoza who farms the eastern portion of the CASP Site including APNs 153-091-007, -008, -009 and -010 (eastern parcels). Mr. Mendoza has been farming the eastern parcels since approximately 2002 for strawberries and other row crops. According to Mr. Mendoza, the eastern parcels contain one agricultural well. No USTs are located on the eastern parcels. There is no known use of Transite™ or other asbestos-containing pipe at the western parcels; irrigation pipe is plastic. There has been no unauthorized waste dumping at the eastern parcels. Mr. Mendoza stated that pesticide application is performed using spray tractors. Mr. Mendoza is not aware of any environmental liens, land use limitations, environmental regulatory actions or environmental cleanups at the eastern parcels.

7.0 SUMMARY OF PHASE I ESA FINDINGS

We have performed a Phase I ESA of the CASP Site in general conformance with the scope and limitations of ASTM *Designation E 1527-13*. Exceptions to, or deletions from, this practice are described in Section 1.3 of this report.

The vast majority of the CASP Site is agricultural land used for row crops (strawberries, lettuce, raspberries, broccoli, etc.). Residential and agricultural-related buildings are located on the western portion of the CASP Site. Agricultural equipment yards are located in the general vicinity of the buildings and throughout the remainder of the CASP Site. The agricultural buildings and equipment yards are utilized to support the agricultural operations and have been or are currently being used to temporarily store fertilizers, pesticides, diesel fuel, gasoline, waste oil, and other materials normally associated with ongoing agricultural cultivation.

Due to the long-term use of the land for agricultural purposes, the CASP Site has the potential for certain environmental conditions related to pesticide application that could have caused these chemicals to be present in the soil. However, the results of environmental site investigations completed for three proposed school sites in the western and central portions of the CASP Site under oversight of the DTSC did not encounter pesticide levels in shallow soil above regulatory screening levels.

The Phase I ESA has identified the following potential environmental concerns in connection with the CASP Site:

- Current and historical use of the Site as agricultural lands and application of pesticides may have had impacted site soils with residual OCPs and associated elevated arsenic concentrations.
- Soil in the area of the residences and structures used to support the agricultural operations may be negatively impacted by metals (specifically lead from lead-based paint on older buildings); OCPs from termiticide application; and PCBs from window caulking or glazing in old buildings.
- The onsite structures may contain asbestos-containing building materials and lead-containing paint.
- A gasoline UST is registered for the Settrini Ranch at 250 Natividad Road (APN 211-013-003 or -008). A gasoline UST was further observed at the ranch compound on APN 153-091-001 in addition to gasoline and diesel ASTs. A diesel AST was observed on APN 153-091-006. Diesel and oil ASTs and drums were further observed on APN 153-091-010.
- Soil in the vicinity of the former electrical substation on APN 211-013-004 may contain PCBs associated with former transformers.

8.0 LIMITED PHASE II ESA

We conducted a Limited Phase II ESA to evaluate the potential presence of OCPs and arsenic (chemicals of potential concern, COPCs) in shallow onsite soil due to the historic agricultural use of the CASP Site. The Limited Phase II ESA included analysis of surface soil samples from agricultural fields throughout the CASP Site.

8.1 Field Investigation

On April 20, 2017, we collected surface soil samples SS1 through SS18 at the CASP Site at the locations depicted on Figure 2. The soil samples were collected using pre-cleaned stainless steel trowels, placed in new laboratory-provided glass jars that were labeled with the sample identification number, collection time, and date. Each sample was placed into a chilled cooler for transport under chain-of-custody protocol to Advanced Technology Laboratories (ATL) of Signal Hill, California. No soil discoloration, “chemical” odor, or other obvious indication of apparent contamination was observed during the filed sampling activities.

8.2 Laboratory Analysis and Results

ATL analyzed the soil samples for arsenic by United States Environmental Protection Agency (USEPA) Test Method 6010B and OCPs by USEPA Test Method 8081. The laboratory analytical results are summarized below and in Table 1. A copy of the ATL analytical report is in Appendix H.

- Arsenic was detected in each of the soil samples at concentrations ranging from 1.6 to 3.4 milligrams per kilogram (mg/kg).

- 4,4´-DDE was detected in 10 of 18 soil samples at concentrations ranging from of 0.0042 to 0.073 mg/kg.
- 4,4´-DDT was detected in 7 of 18 soil samples at concentrations ranging from 0.0038 to 0.024 mg/kg.
- Dieldrin was detected in 4 of 18 soil samples at concentrations ranging from 0.002 to 0.009 mg/kg.
- Toxaphene was detected in 3 of 18 soil samples at concentrations ranging from 0.065 to 0.25 mg/kg.

8.3 Findings of the Limited Phase II ESA

The reported arsenic concentrations exceed DTSC's Health and Ecological Risk Office (HERO) Note #3, DTSC-Modified Screening Level (June 2016) for arsenic of 0.11 mg/kg. However, because of arsenic's natural occurrence in soil, it is typically compared to local, regional, or statewide "background" concentration data. DTSC typically uses a concentration of 12 mg/kg as an upper-bound background concentration although naturally occurring background concentrations can exceed this level depending on the mineralogy of the soils parent material. The reported arsenic concentrations are within the range of naturally occurring background for arsenic in California.

OCPs were not detected in any of the soil samples at concentrations that exceed the USEPA Regional Screening Levels (RSLs) for residential land use in any of the soil samples. Based on the soil sample analytical data for arsenic and OCPs, no further assessment of soil in the agricultural fields for these COPCs appears to be warranted.

9.0 CONCLUSIONS AND RECOMENDATIONS

We have performed a Phase I ESA for the CASP Site in general conformance with the scope and limitations of ASTM E 1527-13. We also performed a Limited Phase II ESA to evaluate the potential presence of elevated pesticides and associated arsenic. The results of the Geohazards Study confirms the CASP Site is suitable for planned development provided the recommendations provided in site-specific geotechnical investigations are followed.

The results of our Limited Phase II ESA show that residual OCP concentrations are present in the onsite shallow soils, but at concentrations less than USEPA residential RSLs. Reported arsenic concentrations are within the range of naturally occurring background levels. Additional assessment of soil in the Site's agricultural fields for OCPs and arsenic does not appear to be warranted at this time.

If an when access is provided, observations and a screening level Phase II ESA soil sampling and analytical testing should be completed for APNs 211-013-003, -007 and -008.

The two known gasoline USTs located on APNs 211-013-003 or -008 (Settrini) and APN 143-091-001 (Christensen) will require proper removal in accordance with Monterey County permit requirements prior to planned development. Unused fuel and oil ASTs and containers located in the vicinity of the agricultural buildings and equipment yards should be properly removed and recycled or disposed of. Any associated petroleum hydrocarbon subsurface impacts associated with the USTs, ASTs and fuel and oil containers/storage areas may require mitigation based on the proposed development land use.

PCB-related soil impacts may exist at the fenced former substation located on the southern portion of APN 211-013-004. Either documentation of completed investigations/mitigation or current soil sampling and analytical testing will be required to determine if subsurface impacts require further assessment or remediation prior to planned development.

Depending on the anticipated future use of the CASP Site parcels, evaluation of the soil around the agricultural operations support buildings (residences, warehouses, barns, etc.) for lead and termiticides should be considered before they are demolished or around the perimeters of the foundations if structures have already been removed. Additionally, based on the age of these structures, it is possible that asbestos-containing materials and/or lead-containing paint are present in the building materials. An asbestos-containing materials and lead-containing paint survey should be completed prior to demolition of the site structures.

Any unused agricultural and domestic wells at the CASP Site will require proper abandonment per Monterey County permit requirements prior to planned development.

Any undocumented subsurface features encountered during development-related construction excavations including USTs, wells, sumps, septic systems, asbestos-containing pipe, debris dumps, treated wood waste, etc., will require proper removal in accordance with any applicable regulatory permit requirements.

10.0 LIMITATIONS AND EXCEPTIONS

This report was prepared for the De Novo Planning Group and the City of Salinas. Geocon-authorized users of this report are limited to the De Novo Planning Group, the City of Salinas, and individuals or organizations deemed appropriate by them.

Users of this report should understand that this project was not a comprehensive characterization of the CASP Site with respect to all media or all chemicals. The Limited Phase II ESA was limited to the specified COPCs for this project and the specific areas identified in this report. The potential exists that areas of the CASP Site have been impacted by the same or other COPCs at concentrations that could require additional investigation to characterize or mitigate.

We do not guarantee or warranty, either express or implied, that there is no environmental, health, or financial risk associated with the specific areas identified in this report, other areas of the CASP Site, or the CASP Site as a whole. Users of this report must evaluate the risk of reliance upon the information herein and assume that risk (if any). Geocon is not responsible for unfavorable results due to reliance on information provided in this report.

Information herein with respect to the condition of the specific areas associated with this project is valid only as of the dates of our field activities. Changes in site conditions not brought to our attention between or subsequent to those dates (if any) could result in the need for additional characterization investigation and/or mitigation activities.

Information in this report and our conclusions and recommendations are based on our site observations, review of the specified regulatory records, and analytical test results of site soil samples for the COPCs identified herein. We do not certify or guarantee that the information obtained and reported by others is accurate or suitable for the intended purpose.

The authors of this report declare that, to the best of their knowledge, the information provided herein is truthful and accurate, notwithstanding unknown incidental errors or omissions that would not materially impact or change results of this project or our conclusions. We strived to conduct activities for this project in accordance with the standard level of care in the local geographic area at the time the activities were rendered.

12.0 QUALIFICATIONS

This Phase I and II ESA and Geohazards Study was prepared by Mr. John Juhrend, PE, CEG and reviewed by Mr. Jim Brake, PG. Mr. Juhrend has over 30 years of experience in the environmental and geotechnical consulting industry in California and Nevada. Mr. Juhrend is a California Professional Engineer and Certified Engineering Geologist, with a BS degree in engineering geology and MS degree in civil engineering. His personal experience includes the performance of hundreds of environmental projects including Phase I and Phase II site assessments, remedial investigations and feasibility studies, corrective action programs and litigation support. His primary expertise includes environmental assessments of transportation corridors, Brownfields properties, and agricultural, industrial, commercial and residential properties.

Mr. Brake has an MS degree in Geological Science and 30 years of experience in environmental investigation and remediation, including implementation of Remedial Investigation/Feasibility Study programs and soil and groundwater remedial actions for private industrial and government clients. He has managed a wide variety of projects for clients in the manufacturing, transportation, mining, automobile and real estate industries including Environmental Protection Agency and DTSC Superfund sites. Mr. Brake has extensive experience in the performance of Phase I and II ESAs of commercial, industrial, and agricultural properties throughout Northern California.

We declare that, to the best of our professional knowledge and belief, we meet the definition of environmental professional as defined in §312.10 of 40 CFR 312 and have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries investigation in general conformance with the standards and practices set forth in 40 CFR Part 312.

John E. Juhrend, PE, CEG
Senior Engineer

Jim Brake, PG

Salinas, California

Subject: Additional Deeper Soil Sampling and Testing

Dear Mr. Lewis:

This letter briefly describes Earth Systems Consultants Northern California (ESCNC) work performed and findings concerning additional deeper sampling and testing of near surface soils on the Matsui/Codiroli properties as requested by Creekbridge Homes. ESCNC recently performed a Phase I Environmental Site Assessment and Limted Phase II Soil Investigation for the subject properties revealing the presence of elevated levels of pesticides including dieldrin, and toxaphene in soil samples collected at a depth of 6-inches. Based on these findings, ESCNC recommended a health-based risk assessment in connection with residential use of the properties. Earth Systems Consultants Northern California (ESCNC)

On February 13, 2001, a registered geologist from our staff collected soil samples at a depth of 18-inches at six distributed locations (S-3A, S-5A, S-7A, S-10A, S-13A, and S-17A) corresponding to our previous sampling locations (see Figure 1, Site Plan). All the samples were collected in clean new brass sleeves and packaged with capped, Teflon-covered ends and placed in a field cooler with ice. The samples were then transferred to Entech Analytical Labs (ELAP #2346) for testing under standard chain-of-custody documentation. All the samples were individually tested for chlorinated pesticides using EPA Method 8080.

No chlorinated pesticides were found to be present in any of the deeper samples. Based on these results, it appears that agriculturally applied pesticides are limited to the upper 1-1½ feet of soil on the site.

LIMITATIONS

This letter and the associated work have been provided in accordance with the general principles and practices currently employed in the environmental consulting profession. This is in lieu of all warranties, express or implied. Our sampling and testing program is necessarily limited.

We appreciate the opportunity to be of service. If you have any questions or require additional information, please feel free to contact us at (831) 637-2133.

PHASE I ENVIRONMENTAL SITE ASSESSMENT PROPOSED NEW SCHOOL SITE PROBERT/MATSUI PROPERTY NORTH OF EAST BORONDA ROAD SALINAS, CALIFORNIA

Prepared For: Salinas Union High School District
320 Rose Street
Salinas, California 93901

January 22, 2009

7. FINDINGS AND RECOMMENDATIONS

On behalf of the District, Kleinfelder performed this Phase I ESA for the site located northeast of East Boronda Road, which included portions of assessor's parcel numbers 153-091-006 and 153-091-007, in Salinas, California, in general conformance with the scope and limitations of ASTM Designation E 1527-05, Public Resources Code Section 21151.8, ECS 17213, SB 162 and AB 387, and CEQA Guidelines Section 15186, and in conformance with our proposal dated February 28, 2008, which was subsequently approved by the Salinas Union High School District. Kleinfelder's findings and conclusions about the site are summarized below.

A review of historical information indicates that the site was used for agricultural purposes from at least 1956 to the present day. The northeastern portion of the site (Matsui property) contained what appear to be ponds from at least 1956 to 1987. Starting sometime between 1987 and 1998, the Matsui property was use was converted to row crops, which appears to have continued to the present day. The southwestern portion of the site (Cordiroli property) appears to have been used for growing cops from at least 1956 to the present day. Legal application of pesticides on agricultural properties can results in elevated concentrations of metals and pesticides in soil. Further, some farming practices included mixing pesticides with irrigation water in ponds. Consequently, Kleinfelder recommends a soil investigation to assess concentrations of arsenic and OCPs in site soil.

A pole-mounted transformer was observed on site. Leaks of dielectric fluid from the transformer could result in PCBs in site soil. Therefore, Kleinfelder recommends a soil investigation in the vicinity of the transformer to assess PCB concentrations in soil.

No structures are located on the site, nor is there evidence of residential or commercial buildings for five decades.

A five-gallon bucket containing hydraulic fluid was noted during the site reconnaissance. No indications of a release near the bucket were noted. Kleinfelder recommends that this bucket be removed prior to purchase of the property.

Limited amounts of burned material were noted during the site reconnaissance in a shallow trench on the east side of the site. Our observations indicated the material was placed in the trench and burned. Our observations did not indicate that the trench contains extensive amounts of buried burned material. Based on the apparent limited amount of burned material, Kleinfelder does not recommend an investigation related to the burned material.

The site is not listed in the regulatory databases searched. No properties within the ASTM-specified search distances were listed in the regulatory databases searched.

If the site is intended to be purchased for the purpose of building a school using funds provided by the State of California, Kleinfelder recommends that this Phase I ESA be submitted to the DTSC for review.

APPROVAL OF TSI PRELIMINARY ENVIRONMENTAL ASSESSMENT REPORT, PROPOSED ELEMENTARY SCHOOL NO 5 – HARROD PROPERTY, NORTHEAST OF EAST BORONDA AND NATIVIDAD ROADS, SALINAS (SITE CODE 204852-83)

Dear Mr. Brusa:

The Santa Rita Union School District (District) via their consultant School Site Solutions, Inc. notified the Department of Toxic Substances Control (DTSC) on April 30, 2010 that it has complied with all public review and comment requirements for the Targeted Site Investigation Preliminary Environmental Assessment (TSI PEA) Report pursuant to Education Code section 17213.1(a)(6)(A). The District made the TSI PEA Report available for public review and comment from March 31, 2010 through April 29, 2010, and a public hearing was held on April 22, 2010. No public comments were received regarding the PEA Report.

In addition, DTSC reviewed the TSI PEA Report (LFR an ARCADIS Company, March 26, 2010) received April 8, 2010. The PEA Report presented investigation results and conclusions based on a health risk screening evaluation for the site.

According to the PEA Report, the proposed site consists of approximately 12.27-acre area located approximately 1,000 feet northeast of the intersection of East Boronda and Natividad Roads in Salinas, Monterey County, California (Site). The Site is located in an area predominantly used for agricultural purposes. The Monterey County Assessor's Office designates the parcel comprising the Site as Assessor's Parcel Number (APN) 153-091-001.

The PEA investigation was conducted to evaluate the Site for the presence of residual pesticides and arsenic in soil associated with the past agricultural activities and assess whether the residual pesticides and/or arsenic pose an unacceptable health risk. The

PEA Report identified organochlorine pesticides (OCPs) above the laboratory reporting limit in the soil samples analyzed. The concentrations of OCPs were compared to their respective California Human Health Screen Level (CHHSL) as established for residential soil by the Cal-EPA, Office of Environmental Health Hazard Assessment (OEHHA 2005). Dieldrin was the only OCP detected above its CHHSL of 35 micrograms per kilogram (μg/kg) for residential soil. Dieldrin was detected in samples HSB-13-0.5 at a concentration of 120 μg/kg and HSB-16-0.5 at 110 μg/kg. The concentrations of dieldrin in the remaining samples range from 8.5 μg/kg to 33 μg/kg with a 95% Upper Confidence Limit of 52.6 μg/kg using the dieldrin results from each of the 27 samples analyzed for OCPs (including samples HSB-13-0.5 and HSB-16-0.5). The 95% UCL of 52.6 μg/kg for dieldrin provides an estimated cancer risk of 2×10^{-6} which is within a risk management range of 1×10^{-6} to 5×10^{-6}. The PEA Report recommends no further environmental evaluation of the Site.

Based on review of the PEA Report, neither a release of hazardous material nor the presence of a naturally occurring hazardous material which would pose a threat to public health or the environment under unrestricted land use was indicated at the Site. Therefore, DTSC concurs with the conclusion of the PEA Report that further environmental investigation of the Site is not required and hereby approves the PEA Report as final.

Chemicals associated with agricultural activities may result in potential risks to human health or the environment. If agricultural activities continue on the subject Site after DTSC issues a no further action determination on the PEA report, DTSC cannot ensure the no further action determination will remain in effect.

This may have impacts for school projects where a District elects to postpone school construction and allow continued agricultural use of the property. The most recent chemical use documentation (i.e., local Agricultural Commissioner Pesticide Application Permits) regarding the quantity and types of agricultural chemicals used on the property was provided in the PEA Report. If the type of agricultural chemicals applied to the Site change after DTSC's no further action determination, DTSC recommends submittal of the chemical use documentation to DTSC at least three months prior to commencement of grading or other construction activities at the school site. DTSC will review the information, and if necessary, may recommend additional sample collection and analyses to assess potential impacts and ensure school site safety.

Pursuant to Education Code section 17213.2(e), if a previously unidentified release or threatened release of a hazardous material or the presence of a naturally occurring hazardous material is discovered anytime during construction at the Site, the District shall cease all construction activities at the Site and notify DTSC. Additional assessment, investigation or cleanup may be required.

If you have any questions regarding this project, you may contact the Project Manager at (916) 255-3577 or by e-mail at JLuevano@dtsc.ca.gov.

Sincerely,

for

Total Number of Soil Samples Analyzed:			23	20	12	20	2	8	21

Notes:
bgs = Below Ground Surface
"X" indicates sample to be analyzed for noted compound during initial analytical event.
* = Samples not collected
1. Sample identification indicates bottom depth of soil sample.
2. Organochlorine pesticides (OCPs) were analyzed using U.S. EPA Method 8081B.
3. Arsenic and lead were analyzed using U.S. EPA Method 6020.
4. Total petroleum hydrocarbons (TPH) were analyzed using modified U.S. EPA Method 8015D to include carbon chain distinction
5. Volatile organic compounds (VOCs) were analyzed using U.S. EPA Method including BTEX, napthalene, MTBE, and oxygenate compounds
6. Polycyclic aromatic hydrocarbons (PAH) including napthalene were analyzed using U.S. EPA Method 8270SIM

APPROVAL OF TARGETED SITE INVESTIGATION PRELIMINARY ENVIRONMENTAL ASSESSMENT REPORT, ELEMENTARY SCHOOL NUMBER 12 – CREEK BRIDGE PROPERTY, EAST BORONDA ROAD AND HEMINGWAY DRIVE, SALINAS (SITE CODE 201851)

Dear Mr. Koenig:

The Department of Toxic Substances Control (DTSC) reviewed the revised Targeted Site Investigation Preliminary Environmental Report (TSI PEA - LFR Inc. an ARCADIS Company, April 28, 2010) received on April 29, 2010. The TSI PEA Report was revised in response to DTSC comments on the draft version submitted on April 20, 2010. The revised TSI PEA Report presents investigation results and conclusions based on a health risk screening evaluation for the site.

In addition, the Alisal Union Elementary School District (District) notified DTSC on April 29, 2010, that it has complied with all public review and comment requirements for the TSI PEA Report pursuant to Education Code § 17213.1, (a)(6)(A). The District made the TSI PEA Report available for public review and comment from March 31, 2010 through April 29, 2010, and a public hearing was held on April 14, 2010. No public comments were received regarding the TSI PEA Report.

According to the TSI PEA Report, the site is 12.01 acres located approximately 1,000 feet north of the intersection of East Boronda Road and Hemingway Drive in Salinas, Monterey County, California. The site is designated as Assessor's Parcel Number (APN) 153-091-006. The District plans to acquire and develop the site for use as an elementary school (K-6 grades). The proposed school is anticipated to have approximately 800 students with 40 classrooms.

A TSI PEA soil investigation was conducted at the site to evaluate the potential presence of lead from lead-based paint and organochlorine pesticides (OCPs) from termiticide in soils adjacent to the former wooden structure; potential residual pesticides and arsenic in site soils from historic and current application of agricultural chemicals; and, total petroleum hydrocarbons (TPHs), including associated compounds lead, volatile organic compounds (VOCs), and polycyclic aromatic hydrocarbons (PAHs) in soils from potential releases of petroleum hydrocarbons adjacent to the above storage tank (AST). The TSI PEA sampling results were used to assess if lead, arsenic, OCPs, and/or TPH, including associated TPH compounds, in soil pose an unacceptable health risk under unrestricted land use standards.

The TSI PEA Report indicated that concentrations of OCPs and lead in soil were below their respective California Human Health Screening Levels (CHHSLs) as established by the Office of Environmental Health Hazard Assessment. TPH as gasoline, VOCs and PAHs were not detected above the laboratory reporting limits. Concentrations of arsenic in soil were below levels of concern. In addition, after conducting a housekeeping action adjacent to the AST, analytical results indicated that residual concentrations of diesel and motor oil were below their respective residential soil Environmental Screening Levels established by the California Regional Water Quality Control Board. The TSI PEA Report concludes no further action is required on the site.

Based on review of the TSI PEA Report, neither a release of hazardous material nor the presence of a naturally occurring hazardous material which would pose a threat to public health or the environment under unrestricted land use was indicated at the site. Therefore, DTSC concurs with the conclusion of the TSI PEA Report that further environmental investigation of the site is not required and hereby approves the TSI PEA Report.

Chemicals associated with agricultural activities may result in potential risks to human health or the environment. If agricultural activities continue on the subject site after DTSC issues a no further action determination on the TSI PEA Report, DTSC cannot ensure the no further action determination will remain in effect.

This may have impacts for school projects where a District elects to postpone school construction and allow continued agricultural use of the property. The most recent chemical use documentation (i.e., local Agricultural Commissioner Pesticide Application Permits) regarding the quantity and types of agricultural chemicals used on the property was provided in the PEA Report. If the type of agricultural chemicals applied to the site change after DTSC's no further action determination, DTSC recommends submittal of the chemical use documentation to DTSC at least three months prior to commencement of grading or other construction activities at the school site. DTSC will review the information, and if necessary, may recommend additional sample collection and analyses to assess potential impacts and ensure school site safety.

Pursuant to Education Code §17213.2(e), if a previously unidentified release or threatened release of a hazardous material or the presence of a naturally occurring hazardous material is discovered anytime during construction at the site, the district shall cease all construction activities at the site and notify DTSC. Additional assessment, investigation or cleanup may be required.

If you have any questions regarding the project, please contact Ms. Mellan Songco, the DTSC Project Manager at (916) 255-6527 or via e-mail at MSongco@dtsc.ca.gov or myself at (916) 255-3695 or vial e-mail at BDuke@dtsc.ca.gov.

Sincerely,

for

PRELIMINARY ENVIRONMENTAL ASSESSMENT
PROPOSED CREEKBRIDGE MIDDLE SCHOOL SITE
APN 153-091-006; 153-091-007
SALINAS, CALIFORNIA

PREPARED FOR:	SALINAS UNION HIGH SCHOOL DISTRICT 320 ROSE STREET SALINAS, CALIFORNIA 93901
BY:	KLEINFELDER 40 CLARK STREET, SUITE J SALINAS, CA 93901
DATE:	May 13, 2010
REVISED DATE:	***August 19, 2010***

ONLY THE CLIENT OR ITS DESIGNATED REPRESENTATIVES MAY USE THIS DOCUMENT AND ONLY FOR THE SPECIFIC PROJECT FOR WHICH THIS REPORT WAS PREPARED.

Project No.: 94134/PW004

Analytical results for arsenic in the thirteen surface soil samples were all below DTSC's working arsenic threshold value for schools of 12 mg/kg, and are presented in ***Table 4***. Copies of the analytical laboratory reports and the chain-of-custody form are included in Appendix *C*.

TABLE 4

ANALYTICAL RESULTS FOR ARSENIC IN SOIL

Sample ID	Sample Depth (feet)	Arsenic (mg/kg)

7.5.2 Sample Analyses for PCBs in Soil

The two surface soil samples collected from within one foot of the pole-mounted transformer were analyzed by Torrent for PCBs using EPA Method 8082. The subsurface soil sample collected at this location was held for potential future analysis, in accordance with the PEA Workplan.

Analytical results for PCBs in the two surface soil samples were all below the reporting limit of EPA Method 8082 and are presented in ***Table 5***. Because PCB concentrations were below the detectable limit of the method (none detected) in both of the surface samples, the remaining subsurface PCB sample (PCB-02) was not tested. Copies of the analytical laboratory reports and the chain-of-custody form are included in ***Appendix C***.

TABLE 5

ANALYTICAL RESULTS FOR PCBS IN SOIL

	Sample ID	**PCB-01**	**PCB-01 Duplicate**	**PCB-02**

7.5.3 Sample Analyses for OCPs in Soil

Nine composite and five discrete soil samples were analyzed by Torrent for OCPs in soil using EPA Method 8081A.

Analytical results for OCPs in the nine composite surface soil samples are presented in ***Table 6****.* The toxaphene concentration or 0.47 mg/kg detected in composite sample KHA6(-01 to -04) was slightly above its California Human Health Screening Level (CHHSL) for residential soil of 0.46 mg/kg. All other OCP concentrations detected in composite samples were at or below their respective CHHSLs. Copies of the analytical laboratory reports and the chain-of-custody forms are included in Appendix *C*.

	TPH – Motor Oil	18	140

7.6 BACKGROUND SOIL SAMPLING

Background soil sampling was not performed as a part of this PEA investigation since PCBs, TPH, and OCPs are not naturally occurring and, if present, would be localized near the sources. Background sampling for arsenic was not required per the workplan.

7.6.1 Statistical Evaluation of Arsenic in Soil

Arsenic is often present in soils due to its ubiquitous natural occurrence in the soils of California and potentially as an agricultural site residue of historical pesticide formulations that contained arsenic. The DTSC provides guidance for sampling arsenic in soil at agricultural sites in Interim Guidance for Sampling Agricultural Fields (DTSC 2008a). Naturally occurring and anthropogenically elevated regional concentrations of arsenic at agricultural sites, such as the Creekbridge property, are often greater than risk-based screening levels for soil. According to the Interim Guidance, if a proposed school property has been adequately characterized for arsenic and all the arsenic data are equal to or less

Diquat	< 4.0	µg/L

calculations were the maximum concentrations of the chemicals for both the discrete and composite soil samples. Air EPCs were estimated from the soil EPCs.

In accordance with recommendations from DTSC for this HHSE (DTSC, 2010), the evaluation of potential risks and hazards from TPH-diesel and TPH-motor oil were evaluated using methodology adapted from the Commonwealth of Massachusetts Executive Office of Environmental Affairs Department of Environmental Protection (2003). As specifically requested by DTSC for this site (DTSC, 2010), the sum of the maximum TPH-diesel and TPH-motor oil detected (145 mg/kg) was used as the initial exposure point concentration for TPH. Because the TPH methodology includes an evaluation of both aliphatic components and aromatic TPH components separately, a weighted approach was required by DTSC. That is, the sum of the maximum detected TPH was multiplied by 50 percent and each of the two EPCs were evaluated separately as aliphatic and aromatic components of TPH splitting the exposure point concentration in half and comparing each half to the RfD.

Table 12 presents the soil EPCs.

TABLE 12

EXPOSURE POINT CONCENTRATIONS FOR SOIL INGESTION AND DERMAL CONTACT

Chemical	Exposure Point Concentration (mg/kg)
DDE	0.17
DDT	0.091
Dieldrin	0.035
Toxaphene	0.47
TPH-diesel/TPH-motor oil – as aliphatics	*72.5 (50% of the sum of 140 mg/kg TPH-motor oil and 5 mg/kg TPH-Diesel)*
TPH-diesel/TPH-motor oil – as aromatics	*72.5 (50% of the sum of 140 mg/kg TPH-motor oil and 5 mg/kg TPH-Diesel)*

The PEA guidance manual also recommends the evaluation of exposure to fugitive dust emissions for non-VOCs (non-volatile organic compounds) based on the assumption that chemicals of concern in surface soil may become airborne due to wind erosion.

The following equation was used to estimate air concentrations (Ca) of the COPC relative to the soil concentration (Cs) at the subject Site:

$$C_a = C_s/PEF$$

The particulate emission factor (PEF) of 5.42 x 10^8 m^3/kg was calculated according to Equation 5 in the Soil Screening Guidance: User's Guide (EPA, 1996, Publication Number 9355.4-23) and incorporated the Q/C value for a 10-acre site in Fresno (37.36 g/m2-s/kg/m3) [Exhibit 11, EPA, 1996]. ***The Q/C value is a site-specific dispersion factor for wind erosion of soil-borne constituents. The Q/C value is the inverse of the geometric mean air concentration to the emission flux at the center of a 0.5-acre-square source (g/M2-s per kg/m3) and a value is selected for a given project when the size of the site and location are known and a similar reference value is available from EPA.***

The estimated air EPCs are presented in ***Table 13*** below. The ***air EPCs*** presented in ***Table 13*** were used to estimate the cancer risk and noncancer hazard that may be associated with inhalation of fugitive dust.

TABLE 13

ESTIMATED AIR CONCENTRATIONS OF THE CHEMICALS OF CONCERN

8.2.4 Risk Characterization And Summary Tables

In accordance with the PEA guidance (DTSC, 1994), estimates of excess cancer risk and noncancer hazard for the soil ingestion, dermal contact, and inhalation exposure pathways using the equations provided in Figures 2.3 and 2.4 of the PEA guidance manual (CalEPA 1994).

Calculation of Cancer Risk for Soil (DTSC, 1994)

$$Risk_{soil} = (SF \times C_s \times (1.57 \times 10^{-6})) + (SF \times C_s \times (3.71 \times 10^{-6}) \times ABS)$$

where:

SF	=	cancer slope factor in units of kg-day/mg
C_s	=	soil concentration in units of mg/kg
ABS	=	chemical-specific dermal absorption fraction (DTSC, 1994), which is unitless

TABLE 15

ESTIMATED CANCER RISK FOR EXPOSURE TO SOIL AND AIRBORNE DUST

Chemicals	Soil Cancer Risk	Airborne Dust Cancer Risk
DDE	1E-07	2E-11
DDT	5E-08	9E-12
Dieldrin	1E-06	2E-10
Toxaphene	1E-06	2E-10
TPHdiesel/TPH-motor oil – as aliphatics	***NA***	***NA***
TPHdiesel/TPH-motor oil – as aromatics	***NA***	***NA***
Sum of Cancer Risk by Medium	***2E-06***	***3E-10***
Cumulative Residential Cancer Risk by all Pathways[1]	***2E-06***	

NA = not applicable because chemical is not considered a carcinogen

TABLE 16

ESTIMATED NONCANCER HAZARD INDEX FOR EXPOSURE TO SOIL AND AIRBORNE DUST

Chemicals	Soil Noncancer Hazard Index	Airborne Dust Noncancer Hazard Index
DDE	NA	NA
DDT	0.003	< 0.001
Dieldrin	0.001	< 0.001
Toxaphene	NA	NA
TPHdiesel/TPH-motor oil – as aliphatics	**0.012**	**< 0.001**
TPHdiesel/TPH-motor oil – as aromatics	**0.040**	**< 0.001**
Noncancer Hazard Index by Medium[1]	**0.065**	**< 0.001**
Residential Noncancer Hazard Index for all Pathways[1]	**0.065**	

NA = not applicable (no RfD values available)
1 = Hazard Index for all chemicals evaluated but values were not segregated by target organ

APPROVAL OF PRELIMINARY ENVIRONMENTAL ASSESSMENT REPORT, CREEKBRIDGE MIDDLE SCHOOL, NORTHEAST OF EAST BORANDA ROAD AND NATIVIDAD ROAD, SALINAS (SITE CODE 204229)

Dear Ms. Luna:

The Salinas Union High School District (District) notified the Department of Toxic Substances Control (DTSC) on May 24, 2011 that the District has complied with all public review and comment requirements for the Preliminary Environmental Assessment (PEA) Report (Kleinfelder West, Inc, August 19, 2010) pursuant to Option A (Education Code §17213.1(a)(6)(A)). The District made the PEA Report available for public review and comment from April 15, 2011 through May 15, 2011, and held a public hearing on April 26, 2011. According to the District notice, no public comments were received regarding the PEA Report.

In addition, DTSC reviewed the revised draft PEA Report received September 3, 2010. The revised PEA Report was prepared in response to DTSC comments on the draft PEA Report forwarded in a letter dated June 17, 2010. DTSC issued a PEA Adequacy letter on September 13, 2010 pending the District's compliance with Education Code §17213.1(a)(6)(A). The PEA Report presents investigation results and conclusions based on a health risk screening evaluation for the site.

According to the PEA report, the site consists of portions of two larger parcels (APN 153-091-006 and 153-091-007) for a site total of approximately 18-acres. The site has been used for agricultural row crop farming since at least 1956. The surrounding land use is agricultural on all sides. The site was investigated for arsenic and organochlorine pesticides (OCPs) in soil in the agricultural row crop farming area, former holding pond, and in an irrigation ditch associated with the potential application of agricultural chemicals; polychlorinated biphenyls (PCBs) in soil associated with a pole-mounted transformer; total petroleum hydrocarbons (TPH) in soil associated with the irrigation well pump; and OCPs, metals, volatile organic compounds, general chemistry, and contaminants of regional concern to assess groundwater quality from an existing irrigation well proposed for continued use by the District as a non-potable water supply source only for the future school.

Based on the results of the PEA investigation, TPH from motor oil were detected in the vicinity of the irrigation well and desander at below levels of concern. Arsenic soil concentrations in 12 discrete samples ranged from 1.9 to 4.0 milligram per kilogram. The OCPs toxaphene, dieldrin, DDT and DDE were detected in soil analyses and identified as chemicals of potential concern (COPCs). The OCPs toxaphene and dieldrin were the only COPCs detected at or above their respective California Human Health Screening Level. The groundwater samples, tested according to Title 22 Drinking Water Standards, resulted in the detection of arsenic at slightly above the maximum contaminant level (MCL) for drinking water. Secondary analytes that exceeded their respective secondary MCL included total alkalinity, calcium, sodium, nitrates and hardness. No other COPC were identified. The PEA concluded that although the estimated residential incremental excess cancer risk was slightly greater than the target incremental cancer risk of 1×10^{-6} typically used by the DTSC for school sites, the combined conservative residential exposure assumptions used in the human health screening evaluation and the use of maximum concentrations leads to a significant overestimate of incremental risks for the proposed middle school, including students and workers. The calculated incremental cancer risks specific to the middle school users would be significantly less than the target incremental risks. Based on the site observations, evaluation of collected COPC data, and the proposed use of the site as a middle school, Kleinfelder recommends no further action at this time for the subject site.

In addition, although the MCL for arsenic and several secondary MCLs (alkalinity, calcium, sodium, nitrates and hardness) were exceeded in the groundwater samples collected, DTSC does not believe that the concentrations reported present an unacceptable risk for use as non-potable water supply source. However, DTSC recommends that the District coordinate with the Monterey County Health Department Division of Environmental Health, Drinking Water Protection Services for additional monitoring and/or well development requirements.

Based on a site inspection and review of the PEA Report, neither a release of hazardous material nor the presence of a naturally occurring hazardous material which would pose a threat to public health or the environment under unrestricted land use was indicated at the site. Therefore, DTSC concurs with the conclusion of the PEA Report that no further environmental investigation of the site is required and hereby approves the PEA Report as final.

Pursuant to Ed. Code §17213.2 (e), if a previously unidentified release or threatened release of a hazardous material or the presence of a naturally occurring hazardous material is discovered anytime during construction at the site, the district shall cease all construction activities at the site and notify DTSC. Additional assessment, investigation or cleanup may be required.

If you have any questions regarding this project, you may contact Mr. Jose Luevano, the DTSC Project Manager at (916) 255-3577 or by e-mail at JLuevano@dtsc.ca.gov or me at (916) 255-3732 or via e-mail at JKoponen@dtsc.ca.gov.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal ERNS list

ERNS: The Emergency Response Notification System records and stores information on reported releases of oil and hazardous substances. The source of this database is the U.S. EPA.

A review of the ERNS list, as provided by EDR, and dated 09/26/2016 has revealed that there is 1 ERNS site within approximately 0.125 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
Not reported	BORONDA ROAD	0 - 1/8 (0.000 mi.)	1	8

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 10/31/2016 has revealed that there are 3 ENVIROSTOR sites within approximately 1.125 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

SCH: This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category. depending on the level of threat to public health and safety or the. environment they pose.

A review of the SCH list, as provided by EDR, and dated 10/31/2016 has revealed that there is 1 SCH site within approximately 0.375 miles of the target property.

Other Ascertainable Records

CUPA Listings: A listing of sites included in the county’s Certified Unified Program Agency database. California’s Secretary for Environmental Protection established the unified hazardous materials and hazardous waste regulatory program as required by chapter 6.11 of the California Health and Safety Code. The Unified Program consolidates the administration, permits, inspections, and enforcement activities.

A review of the CUPA Listings list, as provided by EDR, has revealed that there are 6 CUPA Listings sites within approximately 0.375 miles of the target property.

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the HAZNET list, as provided by EDR, and dated 12/31/2015 has revealed that there are 2 HAZNET sites within approximately 0.125 miles of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 12/05/2016
Date Data Arrived at EDR: 01/05/2017
Date Made Active in Reports: 02/03/2017
Number of Days to Update: 29

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/05/2016
Date Data Arrived at EDR: 01/05/2017
Date Made Active in Reports: 02/03/2017

Last EDR Contact: 03/02/2017
Next Scheduled EDR Contact: 04/17/2017
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

Data Release Frequency: No Update Planned

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 12/05/2016
Date Data Arrived at EDR: 01/05/2017
Date Made Active in Reports: 02/03/2017

Data Release Frequency: Quarterly

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 09/14/2016
Date Data Arrived at EDR: 10/04/2016
Date Made Active in Reports: 10/21/2016
Number of Days to Update: 17

Telephone: 703-603-8704
Last EDR Contact: 01/05/2017
Next Scheduled EDR Contact: 04/17/2017
Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/10/2016
Date Data Arrived at EDR: 10/20/2016
Date Made Active in Reports: 01/06/2017
Number of Days to Update: 78

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water board?s review found that more than one-third of the region?s active disposal pits are operating without permission.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

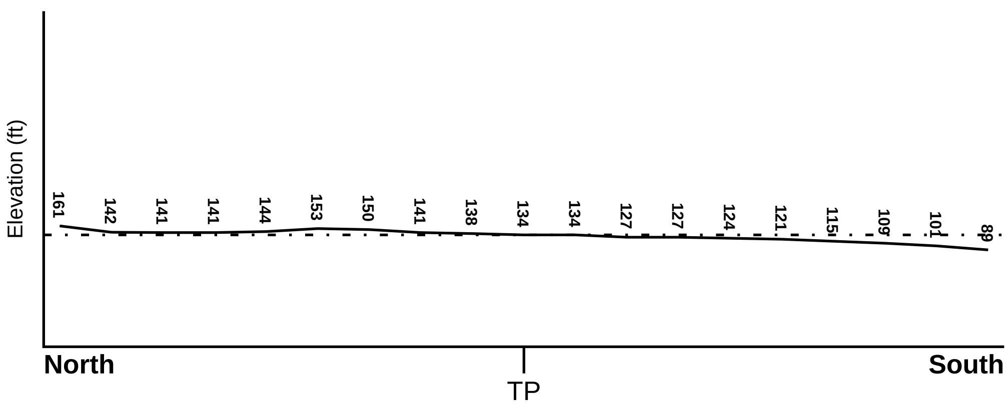
TOPOGRAPHIC INFORMATION

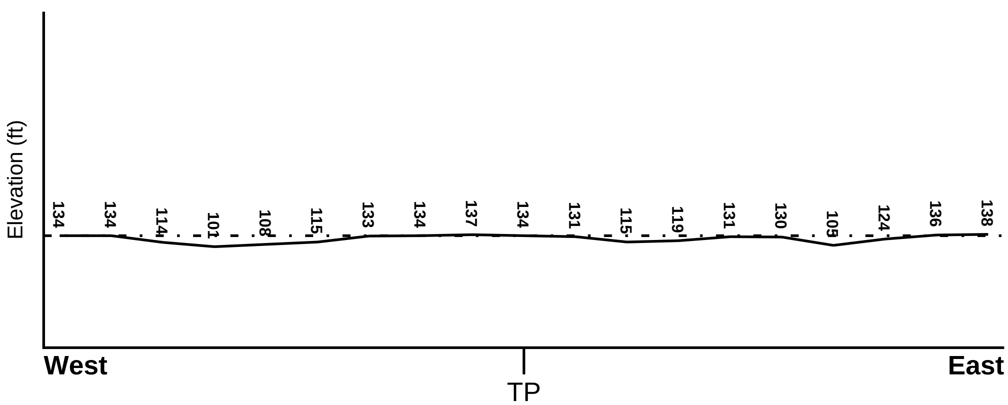
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

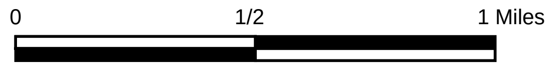
General Topographic Gradient: General ESE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 134 ft.



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06053C0228G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06053C0226G	FEMA FIRM Flood data
06053C0230G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
NATIVIDAD	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

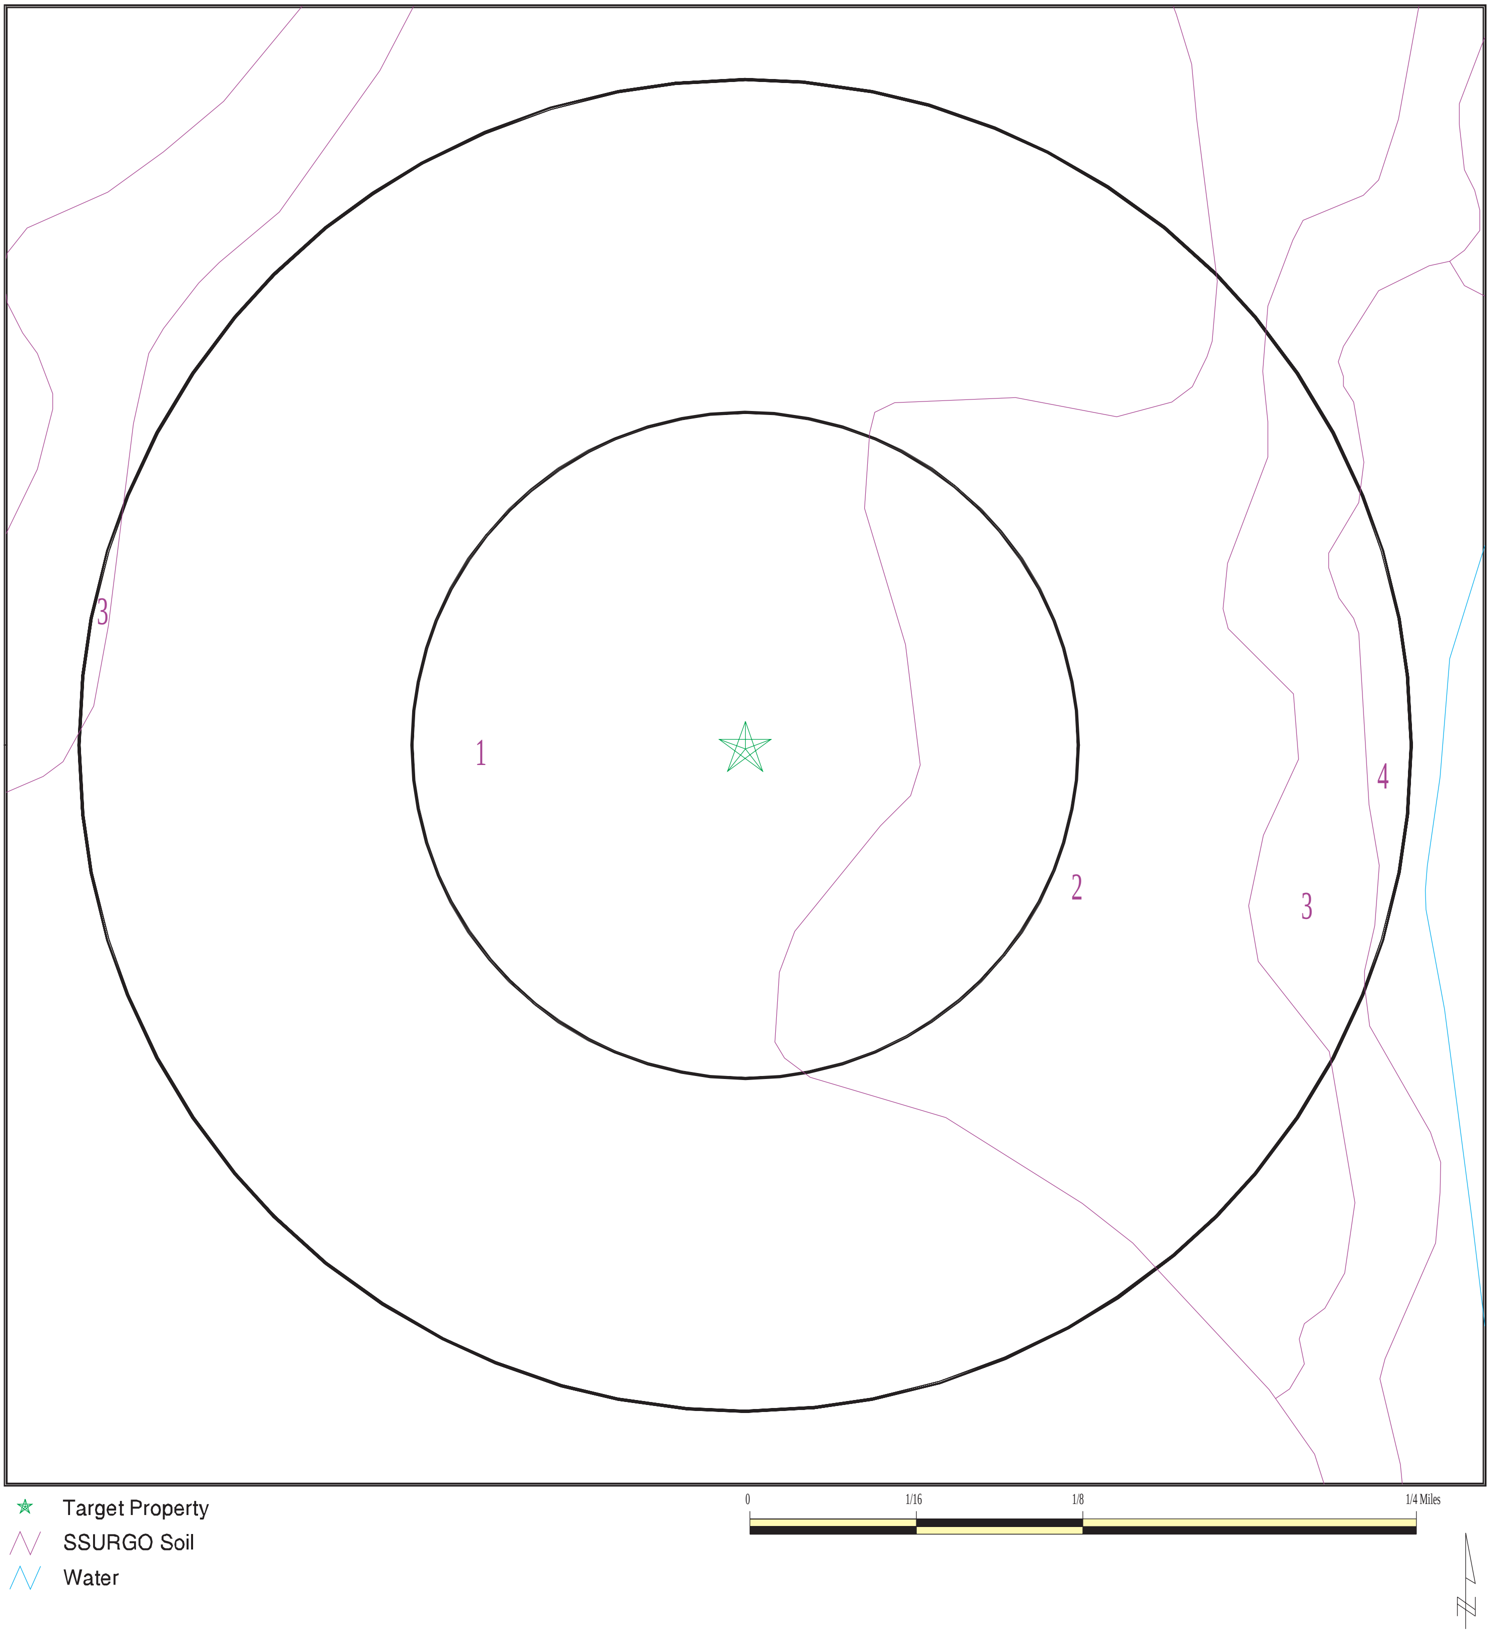
SSURGO SOIL MAP - 4889605.1s



SITE NAME: City of Salinas-CASP ADDRESS: 21000 E. Boronda Rd Salinas CA 93906 LAT/LONG: 36.7176 / 121.6039	CLIENT: Geocon Consultants, Inc. CONTACT: Matthew Tidwell INQUIRY #: 4889605.1s DATE: March 24, 2017 6:25 pm

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Chualar

Soil Surface Texture: loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	20 inches	loam	Not reported	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 7.8 Min: 6.1
2	20 inches	44 inches	sandy clay loam	Not reported	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 4 Min: 1.4	Max: 8.4 Min: 6.1
3	44 inches	59 inches	gravelly sandy loam	Not reported	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Silty Gravel	Max: 4 Min: 1.4	Max: 8.4 Min: 6.1
4	59 inches	79 inches	gravelly coarse sand	Not reported	COARSE-GRAINED SOILS, Sands, Clean Sands, Well-graded sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 6.6

Soil Map ID: 2

Soil Component Name: Placentia

Soil Surface Texture: sandy loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification			
Layer	**Upper**	**Lower**	**Soil Texture Class**	**AASHTO Group**	**Unified Soil**	**Saturated hydraulic conductivity micro m/sec**	**Soil Reaction (pH)**
1	0 inches	12 inches	sandy loam	Not reported	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 7.8 Min: 5.6
2	12 inches	35 inches	clay	Not reported	FINE-GRAINED SOILS, Silts and Clays (liquid limit 50% or more), Fat Clay.	Max: 0.42 Min: 0.01	Max: 8.4 Min: 6.6
3	35 inches	57 inches	sandy clay loam	Not reported	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 0.42 Min: 0.01	Max: 8.4 Min: 7.4
4	57 inches	68 inches	gravelly sandy loam	Not reported	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 1.4 Min: 0.42	Max: 8.4 Min: 7.9

Soil Map ID: 3

Soil Component Name: Xerorthents, sandy

Soil Surface Texture: sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification			
Layer	**Upper**	**Lower**	**Soil Texture Class**	**AASHTO Group**	**Unified Soil**	**Saturated hydraulic conductivity micro m/sec**	**Soil Reaction (pH)**
1	0 inches	59 inches	sand	Not reported	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.3 Min: 5.1

Soil Map ID: 4

Soil Component Name: Danville

Soil Surface Texture: sandy clay loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

USGS 7.5’ Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5’ Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish & Game
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture’s (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 1: FACILITY SUMMARY

FACILITY AREA	FACILITY 1 **ELEMENTARY SCHOOL #12 (CREEK BRIDGE PROPE** EAST BORONDA ROAD/HEMINGWAY DRIVE SALINAS, CA 93906 EDR ID #S109149598
WASTE MANAGEMENT Facility generates hazardous waste (RCRA)	NO
Facility treats, stores, or disposes of hazardous waste on-site (RCRA/TSDF)	NO
Facility has received Notices of Violations (RCRA/VIOL)	NO
Facility has been subject to RCRA administrative actions (RAATS)	NO
Facility has been subject to corrective actions (CORRACTS)	NO
Facility handles PCBs (PADS)	NO
Facility uses radioactive materials (MLTS)	NO
Facility is a FUSRAP Site	NO
Facility is a UXO Site	NO
Facility is a FUELS Site	NO
Facility is an DockHWC/ECHO Site	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	NO
Facility has reported emergency releases to the soil (ERNS)	NO
Facility has reported hazardous material incidents to DOT (HMIRS)	NO
WASTE DISPOSAL Facility is a Superfund Site (NPL)	NO
Facility has a known or suspect abandoned, inactive or uncontrolled hazardous waste site (SEMS)	NO
Facility has a reported Superfund Lien on it (LIENS)	NO
Facility is listed as a state hazardous waste site (SHWS)	NO
Facility has disposed of solid waste on-site (SWF/LF)	NO
MULTIMEDIA Facility uses toxic chemicals and has notified EPA under SARA Title III, Section 313 (TRIS)	NO
Facility produces pesticides and has notified EPA under Section 7 of FIFRA (SSTS)	NO
Facility manufactures or imports toxic chemicals on the TSCA list (TSCA)	NO
Facility has inspections under FIFRA, TSCA or EPCRA (FTTS)	NO
Facility is listed in EPA's index system (FINDS)	NO
Facility is listed in other database records (OTHER)	**YES - p4**
POTENTIAL SUPERFUND LIABILITY Facility has a list of potentially responsible parties PRP	NO
TOTAL (YES)	1

SECTION 3: DATABASES AND UPDATE DATES

To maintain currency of the following federal, state and local databases, EDR contacts the appropriate government agency on a monthly or quarterly basis as required.

Elapsed ASTM days: Provides confirmation that this report meets or exceeds the 90-day updating requirement of the ASTM standard.

DATABASES FOUND IN THIS REPORT

CA SCH: School Property Evaluation Program
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category depending on the level of threat to public health and safety or the environment they pose.

Date of Government Version: 10/31/2016
Database Release Frequency: Quarterly

Date of Last EDR Contact: 01/31/2017
Date of Next Scheduled Update: 05/08/2017

CA ENVIROSTOR: EnviroStor Database
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Completed Document Type: Preliminary Endangerment Assessment Workplan
Completed Date: 09/02/2009
Comments: DTSC conditionally approved the PEA workplan for implementation. Request made not to composite arsenic samples per DTSC Ag-guidance, and clarification added for human health risk evaluation for arsenic.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Environmental Oversight Agreement Application
Completed Date: 02/10/2009
Comments: Received application.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Fieldwork
Completed Date: 10/21/2009
Comments: PEA field work completed on Oct 20 and 21, 2009.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 05/26/2011
Comments: DTSC approved the PEA assessment report with a no further action is required

Future Area Name: Not reported
Future Sub Area Name: Not reported
Future Document Type: Not reported
Future Due Date: Not reported

SECTION 3: DATABASES AND UPDATE DATES

To maintain currency of the following federal, state and local databases, EDR contacts the appropriate government agency on a monthly or quarterly basis as required.

Elapsed ASTM days: Provides confirmation that this report meets or exceeds the 90-day updating requirement of the ASTM standard.

DATABASES FOUND IN THIS REPORT

CA SCH: School Property Evaluation Program
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category depending on the level of threat to public health and safety or the environment they pose.

Date of Government Version: 10/31/2016
Database Release Frequency: Quarterly
Date of Last EDR Contact: 01/31/2017
Date of Next Scheduled Update: 05/08/2017

CA ENVIROSTOR: EnviroStor Database
Source: Department of Toxic Substances Control
Telephone: 916-323-3400
The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 1: FACILITY SUMMARY

FACILITY AREA	**FACILITY 1** **PROPOSED ELEMENTARY SCHOOL #5 HARROD PR** NORTHEST OF EAST BORONDA/NATIVIDAD ROAD SALINAS, CA 93906 EDR ID #S110042438
WASTE MANAGEMENT Facility generates hazardous waste (RCRA)	NO
Facility treats, stores, or disposes of hazardous waste on-site (RCRA/TSDF)	NO
Facility has received Notices of Violations (RCRA/VIOL)	NO
Facility has been subject to RCRA administrative actions (RAATS)	NO
Facility has been subject to corrective actions (CORRACTS)	NO
Facility handles PCBs (PADS)	NO
Facility uses radioactive materials (MLTS)	NO
Facility is a FUSRAP Site	NO
Facility is a UXO Site	NO
Facility is a FUELS Site	NO
Facility is an DockHWC/ECHO Site	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	NO
Facility has reported emergency releases to the soil (ERNS)	NO
Facility has reported hazardous material incidents to DOT (HMIRS)	NO
WASTE DISPOSAL Facility is a Superfund Site (NPL)	NO
Facility has a known or suspect abandoned, inactive or uncontrolled hazardous waste site (SEMS)	NO
Facility has a reported Superfund Lien on it (LIENS)	NO
Facility is listed as a state hazardous waste site (SHWS)	NO
Facility has disposed of solid waste on-site (SWF/LF)	NO
MULTIMEDIA Facility uses toxic chemicals and has notified EPA under SARA Title III, Section 313 (TRIS)	NO
Facility produces pesticides and has notified EPA under Section 7 of FIFRA (SSTS)	NO
Facility manufactures or imports toxic chemicals on the TSCA list (TSCA)	NO
Facility has inspections under FIFRA, TSCA or EPCRA (FTTS)	NO
Facility is listed in EPA's index system (FINDS)	NO
Facility is listed in other database records (OTHER)	**YES - p4**
POTENTIAL SUPERFUND LIABILITY Facility has a list of potentially responsible parties PRP	NO
TOTAL (YES)	1

SECTION 2: FACILITY DETAIL REPORTS

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Re: ATL Work Order Number : 1701689

Client Reference : BORONDA CASP, S1049-03-01

Enclosed are the results for sample(s) received on April 22, 2017 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

for

Eddie Rodriguez
Laboratory Director

3160 Gold Valley Drive, Suite 800		Report To :	John Juhrend
Rancho Cordova , CA 95742		Reported :	05/01/2017

Notes and Definitions

S12	Surrogate recovery outside in-house established limit but within method default criteria.
S1	Surrogate recovery was above laboratory acceptance limit. No target analyte was detected in the sample.
R3	RPD value outside acceptance criteria. Calculation is based on raw values. The analytical batch was validated by the Laboratory Control Sample (LCS).
R	RPD value outside acceptance criteria. Calculation is based on raw values.
M2	Matrix spike recovery outside of acceptance limit due to possible matrix interference. The analytical batch was validated by the laboratory control sample.
L3	Laboratory control sample outside in-house established limits but within method criteria.
ND	Analyte is not detected at or above the Practical Quantitation Limit (PQL). When client requests quantitation against MDL, analyte is not detected at or above the Method Detection Limit (MDL)
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:
(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.
(2) The suffix [2C] of specific analytes signifies that the reported result is taken from the instrument's second column.
(3) Results are wet unless otherwise specified.

1 INTRODUCTION

The proposed Central Area Specific Plan (CASP) will establish land use planning and regulatory guidance that includes land use and zoning designations and policies, development regulations, and design standards for the approximately 760-acre CASP project area. The CASP will serve as a bridge between the Salinas General Plan and individual development applications in the Specific Plan Area, by adding greater specificity to the goals, policies, and concepts for the project area. This report addresses the potential hydrologic and water quality impacts of the project and is structured as an appendix to the Administrative Draft Environmental Impact Statement.

The City of Salinas is located in northern Monterey County, within the Salinas Valley and along the eastern boundary of the Salinas River floodplain. The valley is bounded to the west by the Gabilan Mountain Range and to the east by the Santa Lucia Mountain Range. Salinas is situated approximately 20 miles northeast of the city of Monterey (**Figure 1-1**), 60 miles south of San Jose, 100 miles south of San Francisco and 325 miles north of Los Angeles. Several regional transportation routes are located within or near Salinas, including U.S. Highway 101, State Routes 68 and 183, the Union Pacific Railroad line. Salinas Municipal Airport is a general aviation facility located in the southern portion of the city east of U.S 101.

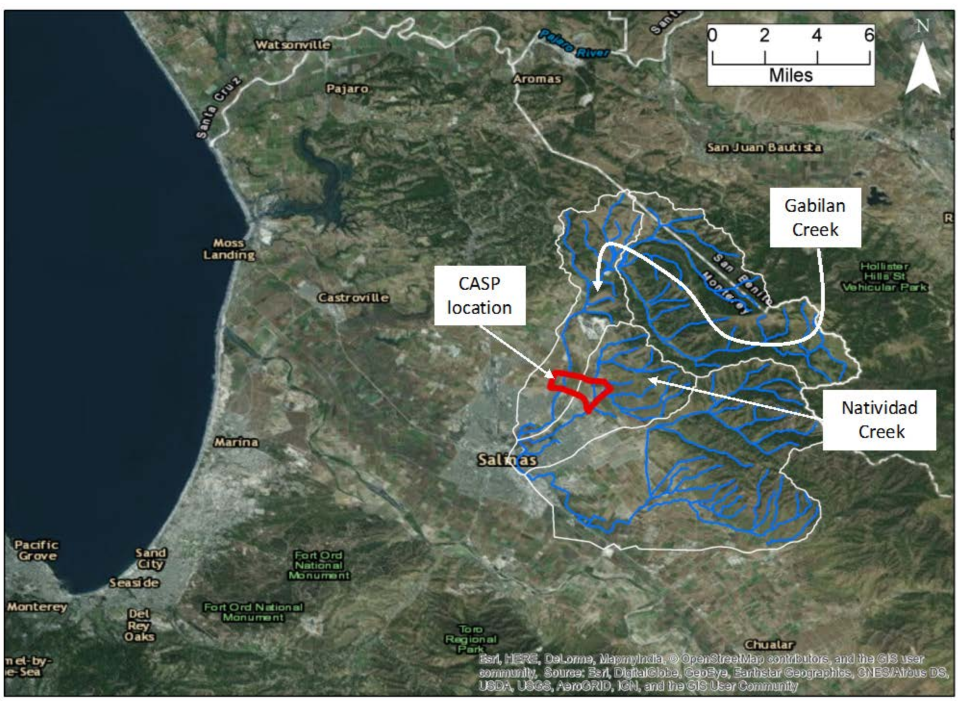

Figure 1-1 Project vicinity.

The CASP project area is located within the incorporated city limits of Salinas except for the northwest corner, which remains outside of city limits. The CASP project area is bounded by Natividad Road on the west, Boronda Road on the south, the future extension of Constitution Boulevard on the east, and Old Stage Road and the future extension of Russell Road on the north. Carr Lake, U.S. 101, and North Main Street are located to the west. Unincorporated land under the jurisdiction of the County of Monterey abuts the CASP project area on the north and northeast.

The mainstem of Gabilan Creek runs roughly north to south through the western portion of the CASP project area. The mainstem of Natividad Creek runs roughly north to south through to the eastern portion of the CASP project area. Two Natividad Creek tributaries enter the CASP project area from the northeast and east, join together, and then join with the mainstem. An additional Natividad Creek tributary joins with the mainstem at the southeastern-most boundary of the CASP project area. Both Gabilan and Natividad Creeks continue downstream and flow into Carr Lake, which is currently used for agriculture but historically oscillated between a shallow lake to swampy wetlands, depending on annual fluctuations of rainfall and runoff conditions. Big Sur Land Trust recently acquired 73 acres of land on the northwest side of the Carr Lake lakebed, and Gabilan Creek flows along that property boundary (Senter and others, 2017). From a flood control perspective, Carr Lake provides the City of Salinas and other downstream properties with the most important flood attenuation function within the regionally significant Reclamation Ditch drainage system (Senter and others, 2017).

The principal objective of the project is the approval and subsequent implementation of the proposed CASP and related entitlements. Proposed land uses include residential, mixed use commercial, community park, neighborhood parks, small parks, and open space. The overall proposed project includes the development of 3,351-3,929 residential dwelling units, up to 370,000 square feet of commercial/mixed use building area, up to 58 acres of public/semi-public facilities, and up to 150 acres of parks and open space land uses including enhanced Gabilan and Natividad Creek corridors, detention/retention/water quality basins, plazas, a greenway network linking all parks/open spaces, a buffer zone along the south side of a Russell Road extension, and residential neighborhood parks (CASP NOP, 2017).

2 EXISTING SITE CONDITIONS

2.1 Land Use, Topography, and Soils

Existing land use consists of lands under agricultural production with associated residences and farm yards (**Figure 2-1**). Under current conditions, groundwater extraction is used to water crops for production. Agricultural crop tilling slows and retains overland flows, allowing irrigated water and precipitation to infiltrate into surficial soils. No paved roads cross the project site.

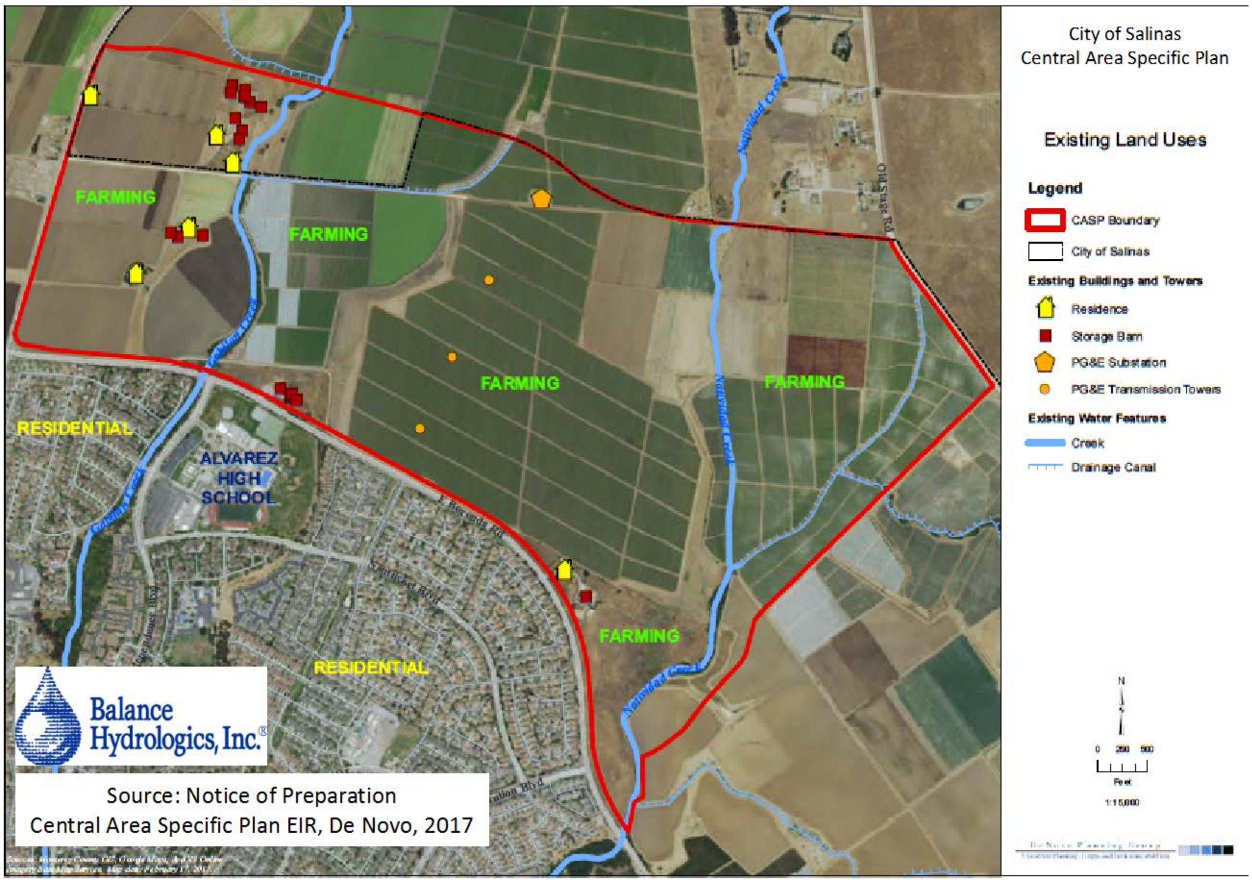

Figure 2-1 Existing land uses. Source: CASP NOP, 2017.

Gabilan Creek topography exhibits about 30 feet of elevational drop from the upstream, north edge of the CASP project area to the downstream, south edge at Boronda Road (**Figure 2-2**). A hillslope rises adjacent to the creek channel to the west that ranges 20-30 feet higher in elevation than the channel bed. Topography to the east is mostly flat across agricultural fields until it rises 25-35 feet in elevation at the watershed divide about mid-project between Gabilan and Natividad Creeks.

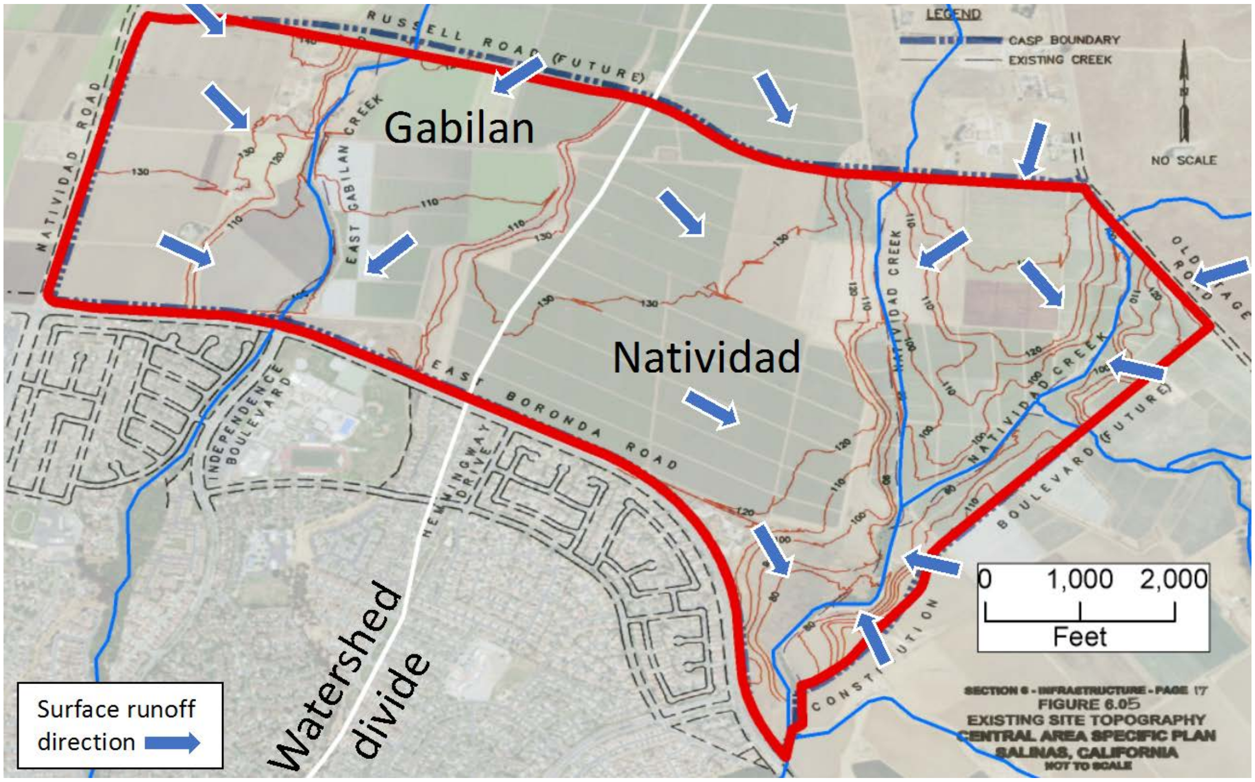

Figure 2-2 Topography, surface runoff patterns, and watershed divide. Overlay source: CASP Draft, 2013.

Natividad Creek topography exhibits higher degrees of elevational variation, with about 75 feet of differentiation from the hillslope between the two tributary channels entering from the north (crossing the future extension of Russell Road) and northeast (crossing Old Stage Road) to Boronda Road (**Figure 2-2**). Hillslopes on both sides of the creek range up to 30-40 feet higher in elevation than the channel bed, especially along the future extension of Constitution Boulevard, and near the downstream project edge at Boronda Road.

General overland flow pathways for surface runoff during rainfall (**Figure 2-2**) are a direct result of existing topography, which includes the overall hilly nature of the CASP project area, tilled agricultural fields that are generally smooth and follow hillslope contours, and overland flow from areas upslope of the CASP boundary. Natividad Creek may experience faster rates of runoff during storm conditions than Gabilan Creek because of steeper hillslopes.

The United States Department of Agriculture and the Natural Resources Conservation Service (WSS, 2017) uses a soils classification scheme of four Hydrologic Soil Groups (HSGs)

A through D. Designation into HSG classification A indicates soils with high infiltration rates that slow progressively in HSG B, C, and D classes. Soils classed as HSG D types generally contain the highest percentage of finely textured sediment grains such as clays that tend to impede the infiltration of water into soils. **Table 2-1** and **Figure 2-3** summarize surficial soil data available for the CASP project area (WSS, 2017). Infiltration rates are highest along much of Gabilan Creek and its historical floodplain to the east toward the watershed divide with Natividad Creek. Lower infiltration capacities for surficial soils in Natividad Creek combined with steeper hillslopes suggest that runoff rates could be higher than those of Gabilan Creek in certain circumstances.

Table 2-1. Soil classification, HSG classification, and approximate infiltration rates for the CASP project area. Source: WSS, 2017.

	Soil classifications	HSG	Infiltration rate inches/hour
Af	Aquic Xerofluvents	--	
AvA	Arroyo Seco gravelly loam, 0-2 percent slopes	A	4.0
AvB	Arroyo Seco gravelly loam, 2-5 percent slopes	A	4.0

2.2 Field Reconnaissance and Geomorphic Summary of Channel Conditions

Field reconnaissance to assess geomorphic and hydrologic conditions at Gabilan and Natividad Creeks was conducted on April 20, 2017 by two Balance Hydrologics staff members. The wet winter of 2016-2017 provided an important perspective into how these watersheds respond to high flows under existing conditions. Reconnaissance included recording observations during a walk along portions of both channels within the CASP project area and at locations upstream and downstream of the project area (**Figure 2-4**). Images in support of the summary in this section can be found in **Appendix A**.

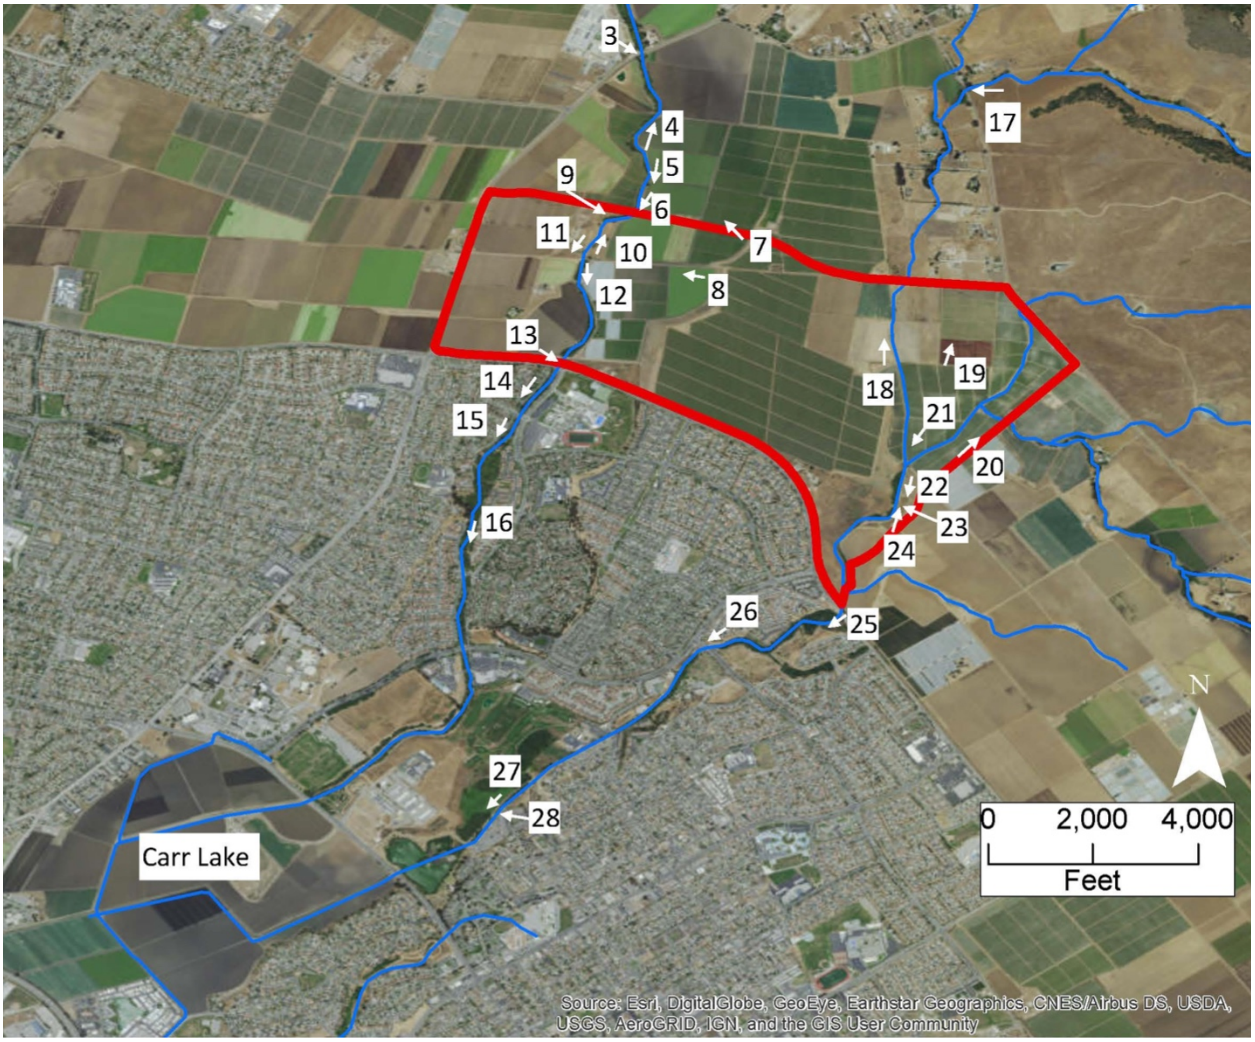

Figure 2-4 CASP field reconnaissance locations. See Appendix A for additional details.

Most creek locations visited during reconnaissance were heavily impacted. Agricultural fields and service roads border many channel banks (**Appendix A**, Figures 4, 5, 6, 18, 20, and 22) and riparian vegetation has been removed to a large extent. Where riparian corridors are present, root structures increase soil cohesion and provide stability to channel banks. Areas with floodplain space directly adjacent to the wetted channel exhibited higher degrees of more natural conditions, which included bar building braiding in-channel and sediment deposition on the floodplain (**Figure 2-5**, **Figure 2-6; Appendix A**, Figures 10, 11 and 25).

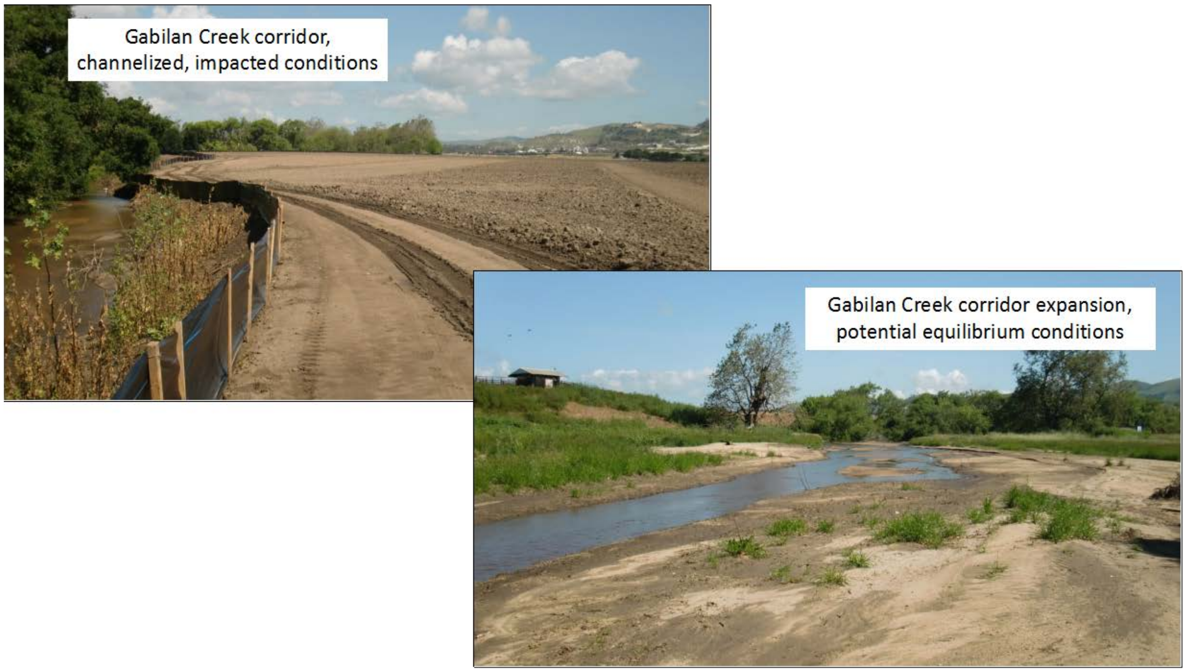

Figure 2-5 Gabilan Creek contains channelized reaches (upper left) and at least one reach with greater channel-floodplain connectivity (lower right).

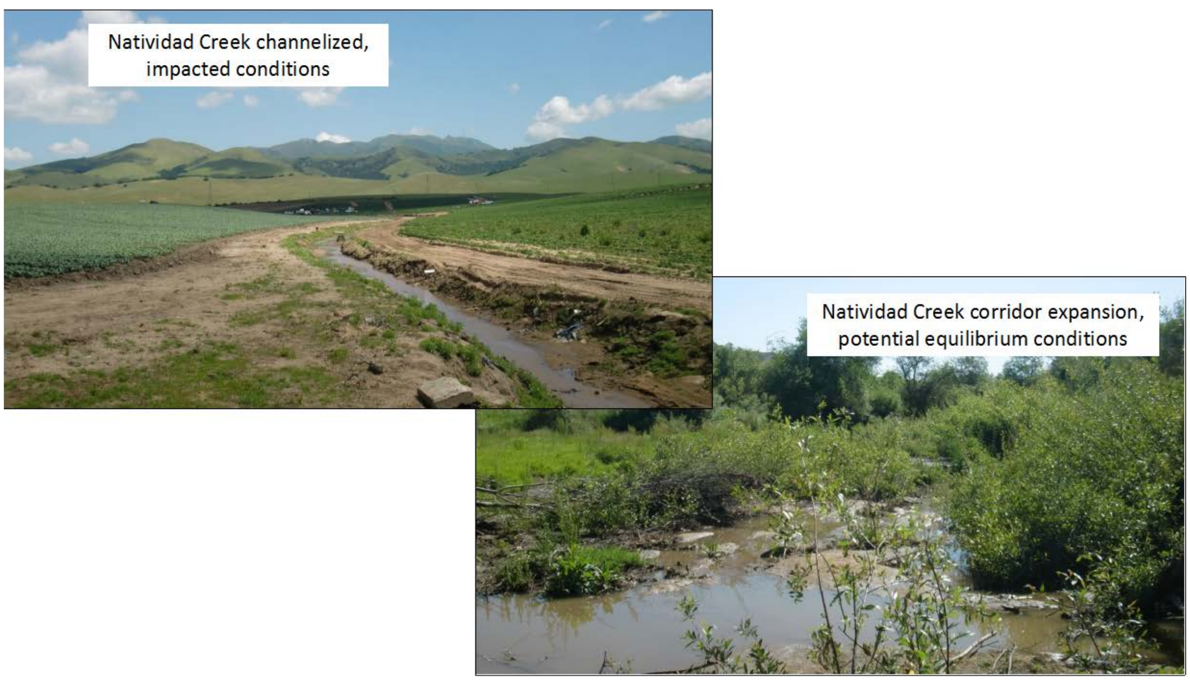

Figure 2-6 Natividad Creek contains channelized reaches (upper left) and channel-floodplain connectivity downstream of Boronda Road (lower right).

Observations recorded in the field provided evidence that both creeks actively responded to rainfall-runoff patterns in wet winter 2016-2017 through variations in discharge and sediment transport loads. High water marks (indicating the highest flows of the season; **Appendix A**, Figures 3, 9, and 12), sediment deposition on floodplains (**Appendix A**, Figures 11, 17, 22, and 23), and channel bar building and braiding (**Appendix A**, Figures 10, 15, and 25) were noticeable effects of recent high flows.

In the Gabilan Creek corridor, sediment loads consisted of fine-grained materials that formed mid-channel bars where possible, indicative of drainages with abundant fine sediments (**Appendix A**, Figures 14 and 15). Sediment loads in Natividad Creek consisted of slightly larger fine-grained materials (**Appendix A**, Figure 23). Natividad Creek corridors are naturally more confined, and agricultural practices exacerbate that condition, so bars and braiding was not as evident. However, once the channel was not confined (**Appendix A**, Figure 25) downstream of Boronda Road, formation of instream bars and braiding was observed (**Figure 2-6**).

On the day of reconnaissance, Gabilan Creek baseflow was estimated as approximately 9 ft^3/sec (**Table 2-2**) at locations 10 and 11 in **Figure 2-4**, whereas Natividad Creek baseflow was estimated as approximately 2 ft^3/sec downstream of the tributary confluence at locations 21 and 22 in **Figure 2-4**.

Table 2-2 Flow characteristics using field estimations.

	Gabilan Creek		Natividad Creek	
	Baseflow	Flood flow	Baseflow	Flood flow
Width (ft)	12.5	150	3	60
Depth (ft)	0.3	3	0.4	3
Velocity (ft/sec)	2.5	5	1.7	5
Discharge (ft^3/sec)	9.4	2250	2.0	900

Notes:
Baseflow was measured using the float method in the field
Flood flows were approximations using high water mark observations obtained in the field

Overbank flows during flood conditions were evident in both creeks. Gabilan Creek contained abundant organic materials (mostly woody branches) that were captured on the upstream side of riparian vegetation (**Appendix A**, Figures 9 and 12). These materials ("high water marks") and floodplain sediment deposition (**Appendix A**, Figure 11) provide evidence of flow depth and lateral extent during recent flood events. Overbank sediment deposition (**Appendix A**, Figure 22) and high water marks (**Appendix A**, Figure 28) were similarly evident in Natividad Creek. Field-based evidence of water depths and extent of floodplain inundation were used to estimate flood flows potentially experienced by the reaches over the wet season (**Table 2-2**).

Differences in watershed size and elevations are likely responsible for a large portion of the variance between estimated baseflows and flood flows (**Table 2-2**). Gabilan Creek to the CASP downstream boundary encompasses about 40.3 sq. mi. (PACE, 2007a) compared to Natividad Creek to the CASP downstream boundary at 9.3 sq. mi. (PACE, 2007a), so Gabilan Creek watershed is four times larger than Natividad Creek with commensurately more runoff potential. Likewise, the orographic effect of mountains can work to "squeeze" precipitation out of moisture-laden clouds in higher elevations. The highest elevation in Gabilan Creek is about 3,100 feet above mean sea level at Fremont Peak, whereas Natividad Creek originates in the lower foothills at an elevation of 1,420 feet (Senter and others, 2017).

Larger watershed area and higher elevations tend to produce more total rainfall, so Gabilan Creek flows should generally persist longer and at higher rates than Natividad Creek, as observed during field reconnaissance. It is important to note, however, that rainfall and stream runoff in any individual storm event could be approximately equivalent within the CASP project area, given the stochastic nature of rainfall events and the likely higher runoff potential of Natividad Creek surficial soils and steeper local hillslopes.

2.3 Hydrology and Surface Water

Average annual rainfall is relatively uniform across the CASP project area, whereas rainfall totals increase in the upland areas of the Gabilan Mountain Range, especially in Gabilan Creek, as a function of elevation. Average annual rainfall at the approximate center of the CASP project area is 15.5 inches based on the most currently-available 30-year record, 1986-2015 (**Figure 2-7**, Prism, 2017). NOAA Atlas 14 precipitation frequency estimates provide a range of forecasted rainfall depths during storms based on precipitation intensity and duration (**Table 2-3**; NOAA, 2017).

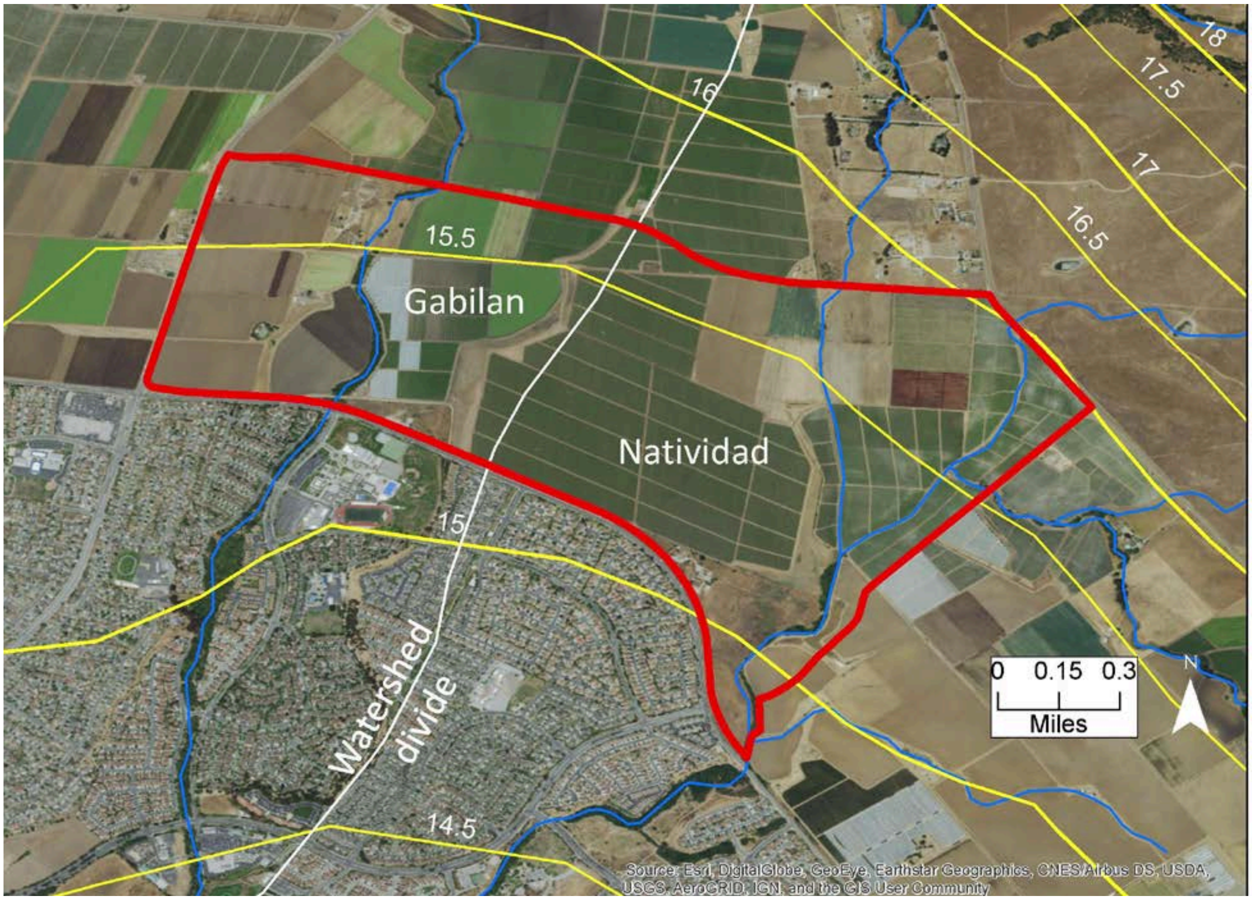

Figure 2-7 Isohyetal map with 0.5-inch rainfall contours. The CASP project area lies almost entirely within the 15 to 16-inch contour intervals. Source: Prism, 2017.

Table 2-3 Precipitation magnitude (inches) and frequency (years) estimates for the CASP project area.

Rainfall depth estimates (inches)

	Return Interval (years)			
Precipitation duration	2	10	25	100
60-min	0.42	0.60	0.75	1.02
6-hr	1.08	1.56	1.90	2.48
24-hr	1.90	2.78	3.38	4.42
3-day	2.77	4.11	5.00	6.48

Source: NOAA Atlas 14 precipitation frequency estimates for the CASP area

2.3.1 Evapotranspiration

Temperature, evapotranspiration (ET), and additional precipitation data were obtained from the North Salinas CIMIS station #116 for a recent period 2003-2015 (**Figure 2-8**). ET varies on a monthly and seasonal basis depending on time of year. The lowest monthly ET average over this period was in December, at 1.46 inches, and the highest was in June, at 4.92 inches, for an annual average of 38.49 inches (CIMIS, 2017). Annual ET rates ranged from 33-43 inches, whereas annual rainfall ranged from about 8-20 inches. Approximately twice the ET rate as rainfall indicates that water deficits are substantial even with a mild annual mean temperature of 54° Fahrenheit, thus the need for groundwater extraction to support regional and local agricultural practices.

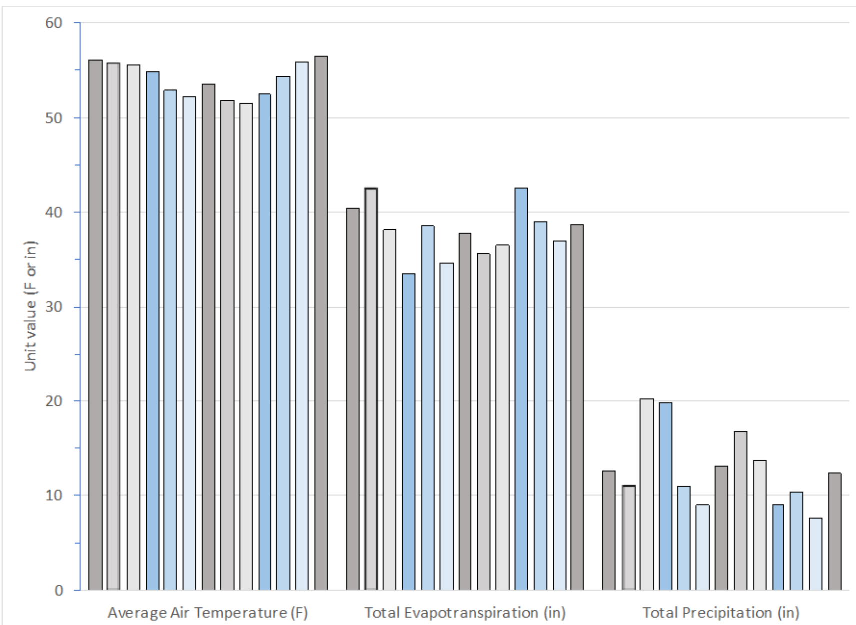

Figure 2-8 Annual mean temperature, evapotranspiration, and precipitation data, with 2003-2015 represented from left to right in each data set. Source: CIMIS, 2017.

2.3.2 Carr Lake as FEMA Floodway

Gabilan, Natividad, and Alisal Creek watersheds drain to Carr Lake (**Figure 2-9**), the largest of a series of historical lakes along the eastern boundary of the Salinas River floodplain. Runoff from these watersheds conveys through Carr Lake via the Reclamation Ditch (Ditch) drainage system to Tembladero Slough and then into Monterey Bay, located approximately ten miles northwest of Salinas. The importance of Carr Lake to the region is most clearly indicated by the designation of the entire footprint of the lakebed as a floodway by the Federal Emergency Management Agency (FEMA FIRM, 2009). This floodway designation means that no changes can be made to the storage capacity of the lakebed without FEMA approval. Carr Lake was first designated as a FEMA floodway in the late 1970's, and continues to provide the City of Salinas and other downstream properties with some of the most important flood attenuation functionality within the regionally significant Ditch drainage system.

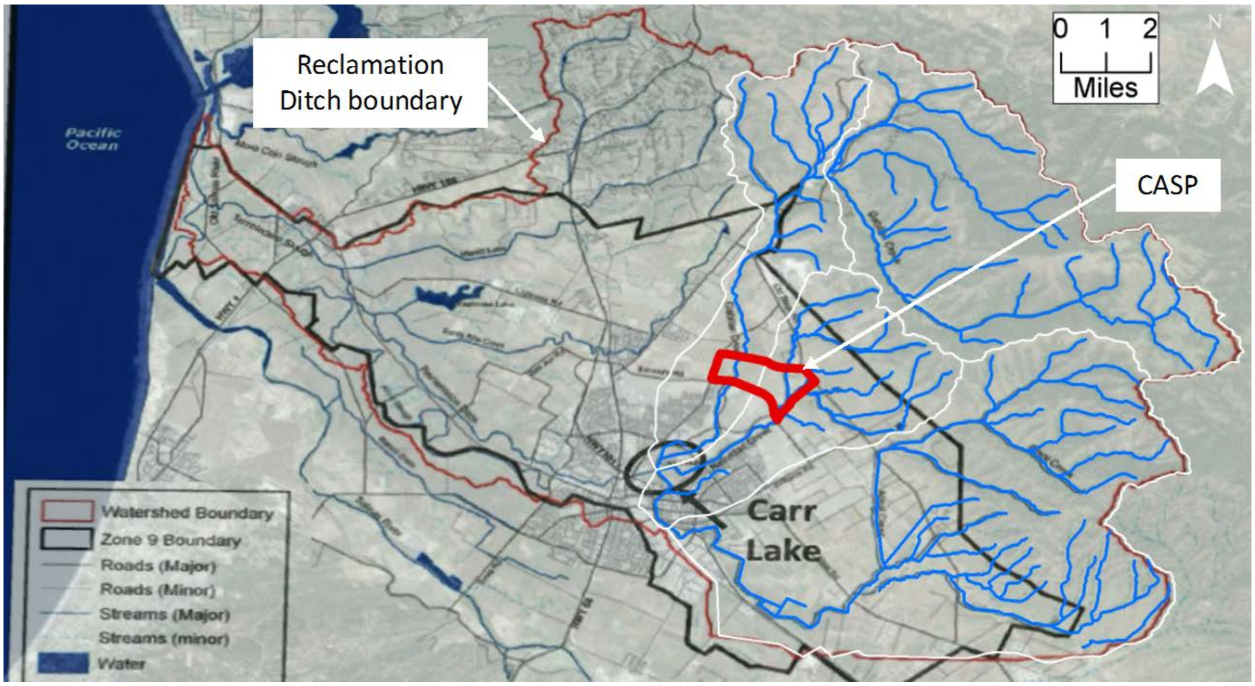

Figure 2-9 Reclamation Ditch drainage area. Overlay source of Reclamation Ditch boundary: Casagrande and Watson, 2006; overlay source of Carr Lake watershed: Senter and others, 2017.

Schaaf and Wheeler (2002), in their Carr Lake flood control study, estimated that a potential 66 percent increase in impermeable surface areas upstream of Carr Lake would result in a 4 to 9 percent increase in peak flows during storm events, with more frequent storm events posing a greater relative increase in peak flows. Moreover, the storm drain system of the City of Salinas operates at or near capacity during large storm events (SWMP, 2004). In the years since these studies, the City has adopted stormwater management policies that include requirements of no increases in peak flow from new development (SWDS, 2013), policies that include developments in the CASP project area.

Gabilan and Natividad Creeks constitute approximately 60 square miles of surface runoff through Carr Lake, with Alisal Creek contributing surface runoff from another 40 square miles. The Ditch system was built in the early 1900s to keep the lakes and upstream lands, such as those in the CASP project area, drained for agricultural use. The Ditch was not built with flood conveyance capacity for a growing City of Salinas in mind, so the amount of discharge the system can attenuate and convey is at its limit, and highlights the importance of Carr Lake as a flood storage area near the upstream extent of the Ditch system (Senter and others, 2017).

Carr Lake itself functions within the Ditch system as a thru-flow detention basin with passive flow controls. Drainage out of the lakebed under the North Main Street bridge under low flow conditions exits through a 36-inch diameter pipe positioned below a much larger double 8 ft x 8 ft box culvert that activates once water surface elevations increase enough. The 36-inch outlet is undersized compared to those further downstream and therefore restricts peak flows and downstream flooding (Schaaf & Wheeler, 2002). The current configuration limits outflows during small storms to the capacity of the existing 36-inch culvert, at an invert elevation of 30.54 feet, until lakebed water surface elevations reach the bottom of the box culvert invert elevation of 35.98 feet (Ballman and others, 2015). This results in water surface elevations within the lakebed over 5 feet deep at the outlet prior to an increase in outflow discharge, and creates a large volume of water that is limited to a maximum discharge in the range of 60-70 ft^3/sec through the 36-inch culvert.

These limitations to outflows from Carr Lake combined with the flat, low slope configuration of the lakebed (which has been under agricultural use for decades) means that flood inflows spread out relatively evenly across lakebed land surfaces at a given elevation, resulting in two important consequences for flood conditions. First, as just discussed, the lakebed water surface elevation remains shallow for an extended period, so outflow remains in the 60-70 ft^3/sec range for an extended period too, regardless of how large or small upstream inflows are, until water surface elevations are high enough for the box culverts to become engaged. Second, the same principles apply at the end of a flood event, so standing water will remain for days as a function of the outflow capacity of the low flow culvert. Inefficiencies in the flood routing capacity of the lakebed combined with inefficiencies of the North Main Street culvert to move flows downstream as peak discharges recede have been noted in almost every report that has focused on Carr Lake over the past 40 years (Senter and others, 2017). Restricted flows thus result in partial flooding of the lakebed during most storm events. During a 2-year return interval flow event (i.e. a discharge that occurs on average every 2 years), more than half of the lakebed can be flooded. During a ten-year event, nearly 90% of the lake bed is inundated and in a 25-year event, the entire lakebed, including the

Sherwood Lake Mobile Home Park, may be inundated. During a 100-year event, water elevations could spill onto Highway 101 and into parts of downtown Salinas (Schaaf & Wheeler, 2002).

The 1995 and 1998 El Nino wet winter seasons illustrate how substantial flooding and property damage can occur during high rainfall/heavy flooding conditions. During the 1995 water year, the City of Salinas received 20.1 inches of rainfall, approximately 6 inches above the annual average. Rainfall in the southern half of the Salinas Valley was more substantial (25.3 inches in King City) which caused the Salinas River to peak at 95,000 cfs at the USGS #11152500 Salinas River near Spreckels gage. Salinas River high flows overtopped its banks at several locations sending river water onto flat areas within Salinas. Meanwhile, Carr Lake was completely flooded due to heavy runoff from the Gabilan, Natividad, and Alisal Creek watersheds. Similarly, in water year 1998, the City of Salinas received 30.1 inches of rain (second highest total on record). Detained flows in Carr Lake reached an elevation of 42.9 feet, flooding the Sherwood Lake Mobile Home Park for 11 days. Properties, agricultural fields, and the drainage system itself were damaged (Casagrande and Watson, 2007) because of so much rainfall and subsequent runoff.

In addition to flood routing and outflow capacities, the lakebed channels and the Ditch downstream of Carr Lake are impacted by sediment transport from the upper watersheds (identified as mostly from agricultural fields; SWMP, 2004), which requires regular maintenance and dredging (Casagrande and Watson, 2006). Studies predict that conversion of land from row crops to residential will result in reductions of sediment loads (Woodward and Foster, 1997), so development of the CASP project area may result in sediment load reductions at Carr Lake and the downstream Ditch system.

In summary, Carr Lake is critical as a FEMA flood control detention/attenuation basin to the City of Salinas and surrounding areas. The Ditch system cannot accommodate any additional stormwater loading, and City of Salinas neighborhood stormwater drain systems are also at capacity. Any impacts (whether positive or negative) that occur in the CASP project area will translate directly downstream into and through Carr Lake.

2.3.3 PEAK FLOW ESTIMATES

Peak flow estimates under existing conditions were modeled and reported by PACE (2007a) at some CASP project boundaries (**Table 2-4**). A review of their supporting documentation suggests that all contributing areas upslope of CASP project boundaries were included in modeling runs. Gabilan Creek results indicate that the CASP project area contributes a minor amount of runoff into the creek corridor between the upstream inflow at future Russel Road and the downstream boundary at Boronda Road, with the largest increase associated with the long-duration 72-hour event (**Table 2-4**). This result seems reasonable, as high infiltration capacities associated with the historical floodplain eventually slows as soils become fully saturated (**Figure 2-3**; also Carpenter and Cosby, 1925; **Appendix A**, Figure 1).

Table 2-4 Modeled peak flows under existing conditions.

Modeled Discharge Location	Peak flow Rainfall duration (hours), return interval (years) 24 h, 10 yr	 24 h, 100 yr	 72 h, 100 yr
Gabilan Creek	*cfs*	*cfs*	*cfs*
Upstream future Russell Road extension	2236	11414	13397
Downstream boundary @ Boronda Road	2283	11423	13707
Natividad Creek			
Upstream boundary @ future Russell Road extension	284	1006	1357
Upstream boundary @ future Constitution Blvd extension	124	635	973
Downstream boundary @ Boronda Road	513	2020	3089

Natividad Creek model results (PACE, 2007a) reported at the Boronda Road downstream extent include about 20% of flow of unknown origination, likely because the tributary that drains across Old Stage Road (**Figure 2-2**) was not included in reported results. Natividad Creek hillslopes are steeper, closer to the creek corridor, and soils are less permeable than those in Gabilan Creek (**Figure 2-3**). These features suggest that runoff rates in Natividad Creek may be higher relative to Gabilan Creek runoff rates in the form of flows peaking more quickly at higher velocities during intense rainfall events. On the other hand, total discharge at the downstream boundary is substantially lower in Natividad than Gabilan for each modeled flow by about 4-5 times (**Table 2-4**), as would be expected with watershed area and elevation differences.

2.3.4 Existing Stormwater Conveyance System

There are no existing City of Salinas storm drain lines upstream of or within the CASP project area. Under existing conditions, runoff flows toward Gabilan Creek or Natividad Creek according to general overland flow pathways (**Figure 2-2**). Runoff downstream of the CASP project area is conveyed through the Ditch system either as flows in the creeks or into the City of Salinas storm drain system as defined in the City of Salinas Stormwater

Master Plan (SWMP, 2004; **Figure 2-10**; upgrades or additions to the storm drain system since 2004 are not represented in this figure).

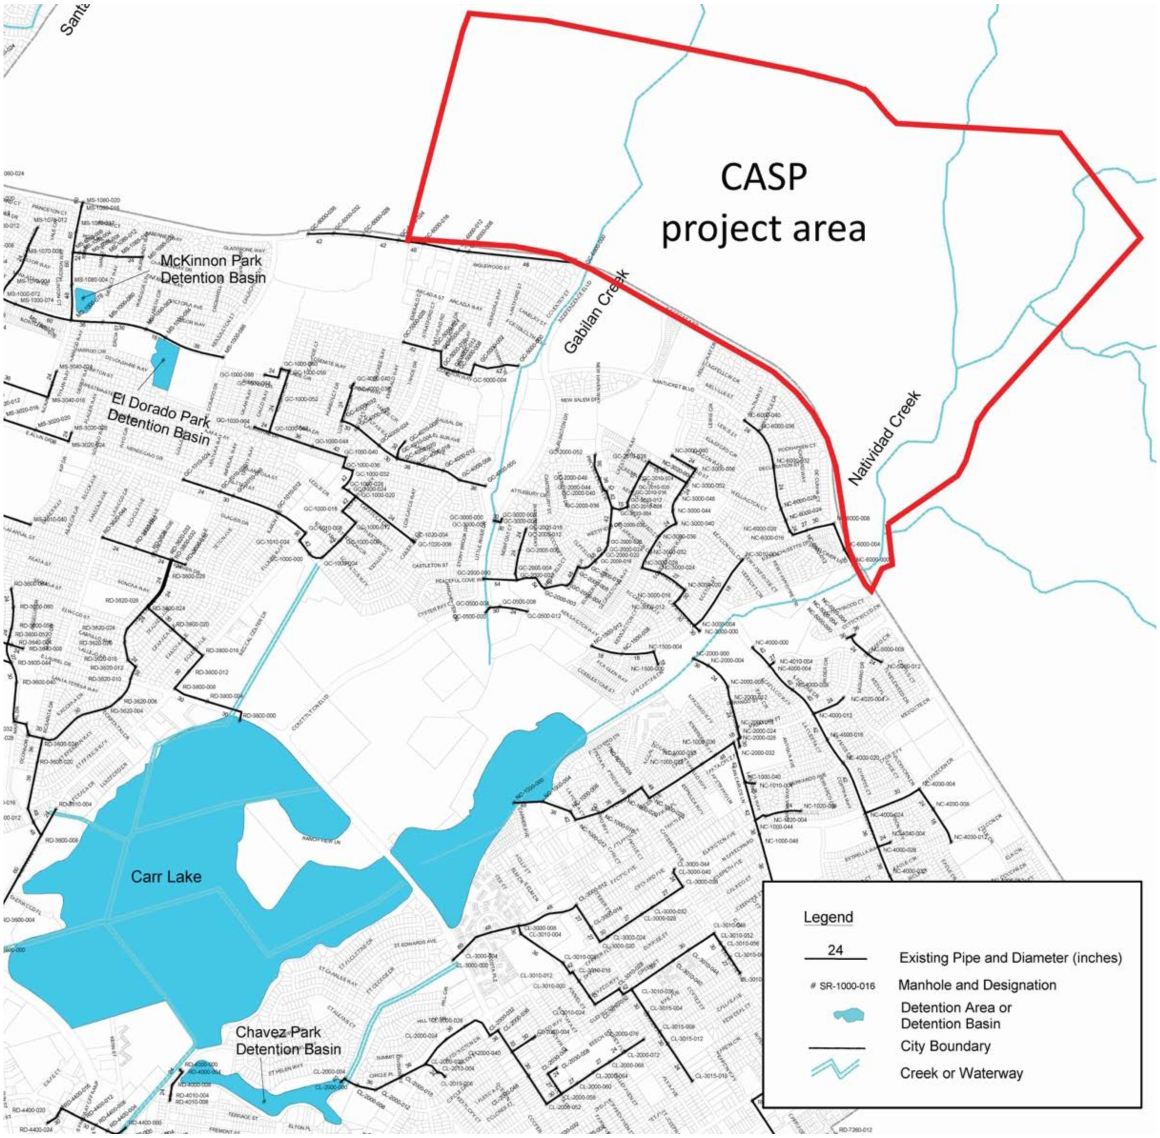

Figure 2-10 Approximate boundaries of the CASP project area and City of Salinas storm drain system, circa 2004. Source: SWMP, 2004.

The City of Salinas Stormwater Master Plan (SWMP, 2004) makes the following statements regarding the potential effects of urbanization in the CASP area:

- Existing storm drains within Salinas are at maximum capacity and cannot accept increased peak flows without causing additional flooding.

- The Reclamation Ditch system does not have capacity for additional runoff.
- Detention storage within the CASP project area will be required for all new development that contributes runoff to Gabilan and Natividad Creeks to avoid adversely impacting drainage through Carr Lake and the Reclamation Ditch system.
- Depending on the location of future detention basins, detention storage areas could be drained to an existing 42- and 48-inch pipe in Boronda Road between El Dorado Drive and Gabilan Creek that currently conveys agricultural runoff from north of Boronda Road to Gabilan Creek. The hydraulic capacity of the pipe is 50 cfs for the 42-inch segment and 120 cfs for the 48-inch segment.
- The eastern portion of the area north of Boronda Road and west of Williams Road drains to Natividad Creek. There are no existing City storm drain facilities with the capacity to serve this area. Detention storage within the CASP project area will be required prior to discharge to Natividad Creek or its tributaries to avoid adversely impacting drainage through Carr Lake and the Reclamation Ditch system.

In summary, the Ditch system at and downstream of Carr Lake cannot accommodate additional stormwater loading and the City of Salinas stormwater drain systems are at or very near capacity during flood events. All runoff from the CASP project area will need to be managed within the project area.

2.4 FEMA Flood Zones

Predicted flood zones located in the CASP project area in the Gabilan and Natividad Creek corridors are shown on FEMA FIRM panels 06053C0226G, 06053C0228G, and 06053C0230G (FEMA FIRM, 2009; **Figure 2-11**). Gabilan Creek flood flow predictions were modeled by FEMA using flow data from the USGS #11152600 Gabilan Creek near Salinas gage (out of service as of October 2014). Natividad Creek flood flow predictions were approximated, which is a typical FEMA practice for smaller, ungaged watersheds.

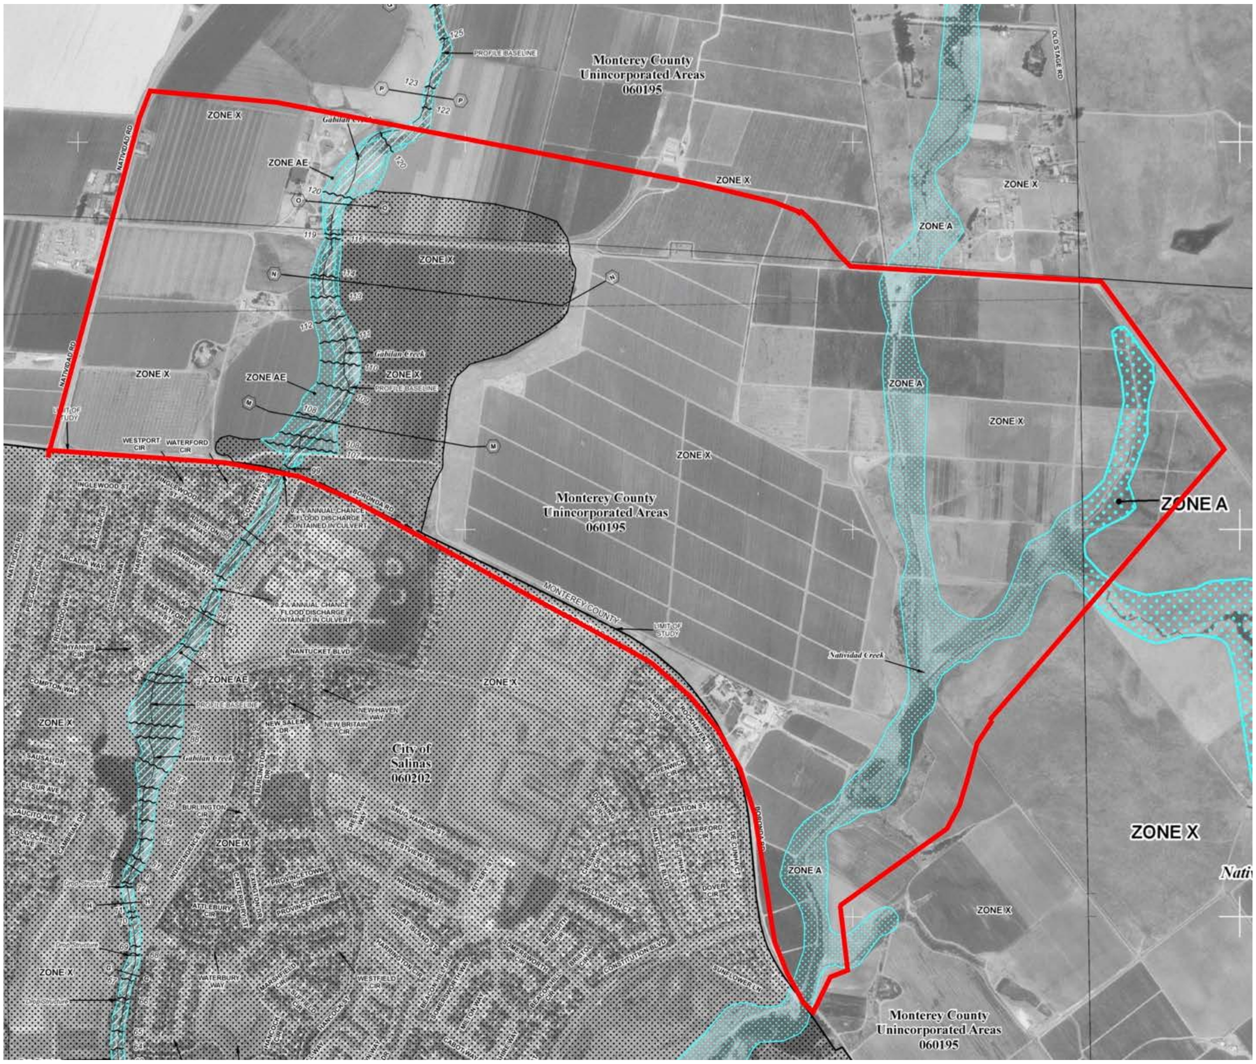

Figure 2-11 FEMA zones within the CASP project area.

Delineated flood zones include areas adjacent to both creek channels; these are depicted in an aqua/green color along all corridors (**Figure 2-11**). Along Gabilan Creek, Zone AE indicates areas inundated by a 1% annual chance flood (i.e., a 100-year flood event), and where water surface elevations (in feet) have been determined using modeling techniques. Those elevations can be seen in **Figure 2-12** next to cross-section lines bisecting the creek. Along Natividad Creek, Zone A indicates areas that will be inundated by a 1% annual chance flood, but for which no water surface elevations have been calculated because of the approximation technique used for ungaged watersheds. Shaded Zone X areas are Special Flood Hazard Areas anticipated to be limited to less than one-foot of flooding depth during a 100-year event and/or subject to flooding between the 100- and 500-year events. Changes to land surfaces in these zones will trigger required FEMA map revisions, with flood insurance requirements based on modeled flood conditions using final grading plans for the CASP project area.

Areas that are designated as unshaded Zone X are not expected to flood up to the level of a 500-year event. Changes to land surfaces in unshaded Zone X areas do not trigger FEMA map revisions and no flood insurance requirements are imposed on structures in these areas.

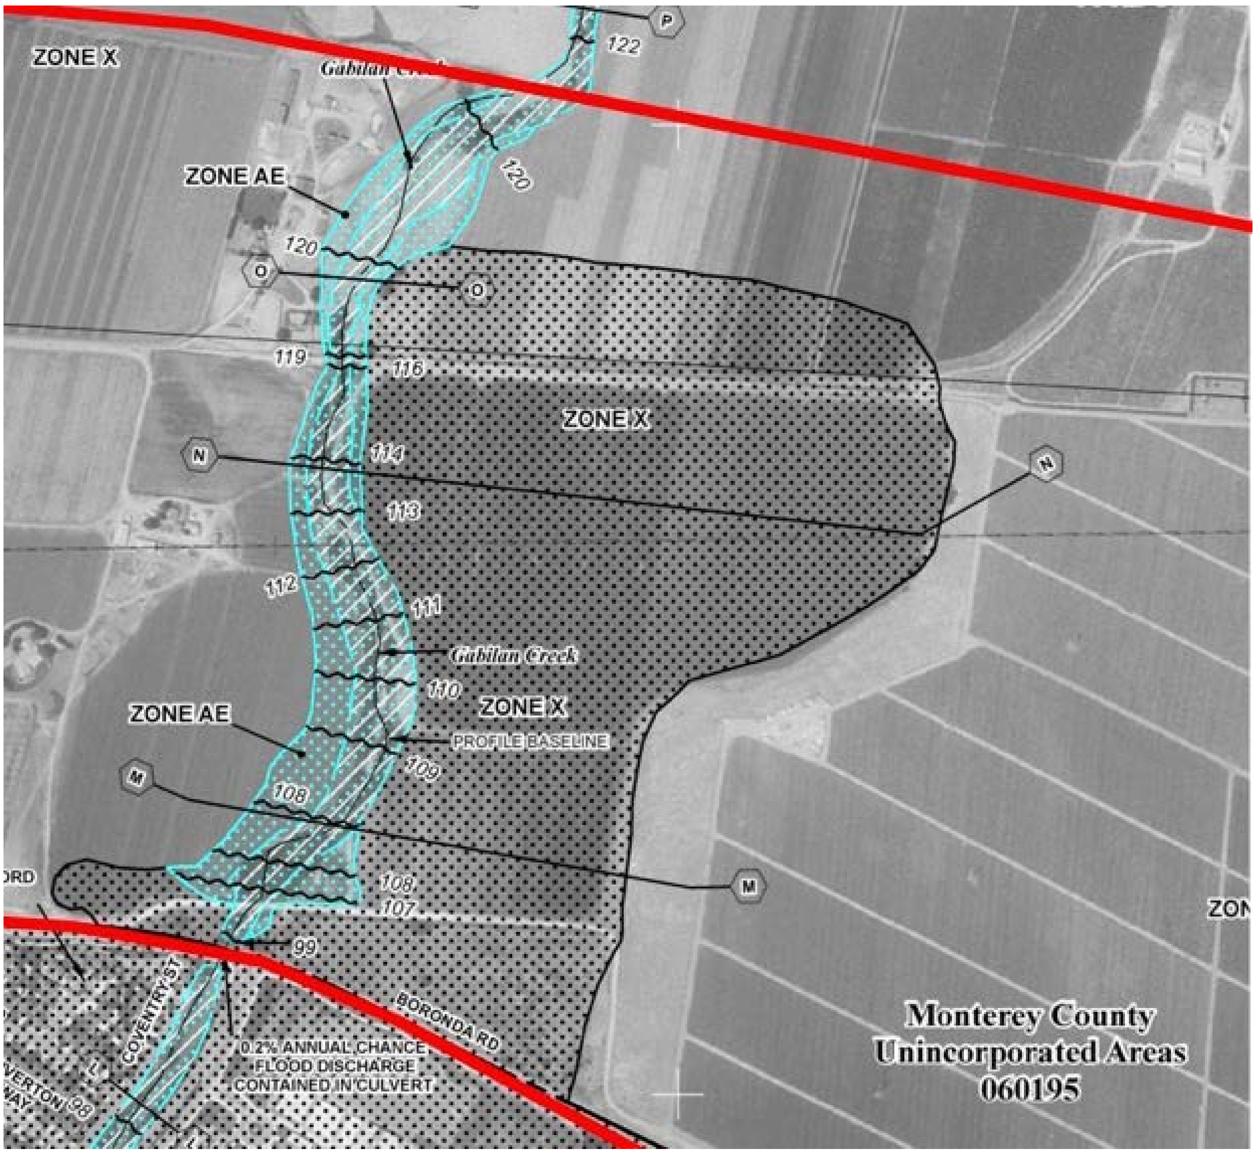

Figure 2-12 Detail of FEMA-predicted flooding in Gabilan Creek within the CASP project area, including delineations of Zone AE (flood zone), shaded Zone X (Special Flood Hazard Area), and unshaded Zone X (no flood insurance requirements).

2.5 Groundwater Quantity and Quality

The California Sustainable Groundwater Management Act (SGMA) was passed by the California State Legislature in 2014 (SGMA, 2014). As required by the SGMA, a Salinas Valley Groundwater Basin planning process is underway (SVGBP, 2017), with local stakeholders working to create a collaborative plan for sustainable groundwater use in the Salinas Valley Basin by 2020. The CASP project area is located in the East Side aquifer sub-area of the Salinas River Groundwater Basin (**Figure 2-13**). Surficial soils are primarily alluvium formed by alluvial fan deposits originating from the Gabilan Mountain Range (USDA-SCS, 1978), with incomplete separation of the aquifers from the soil surface by aquitards that are generally clay layers that have very low permeability and infiltration capacities.

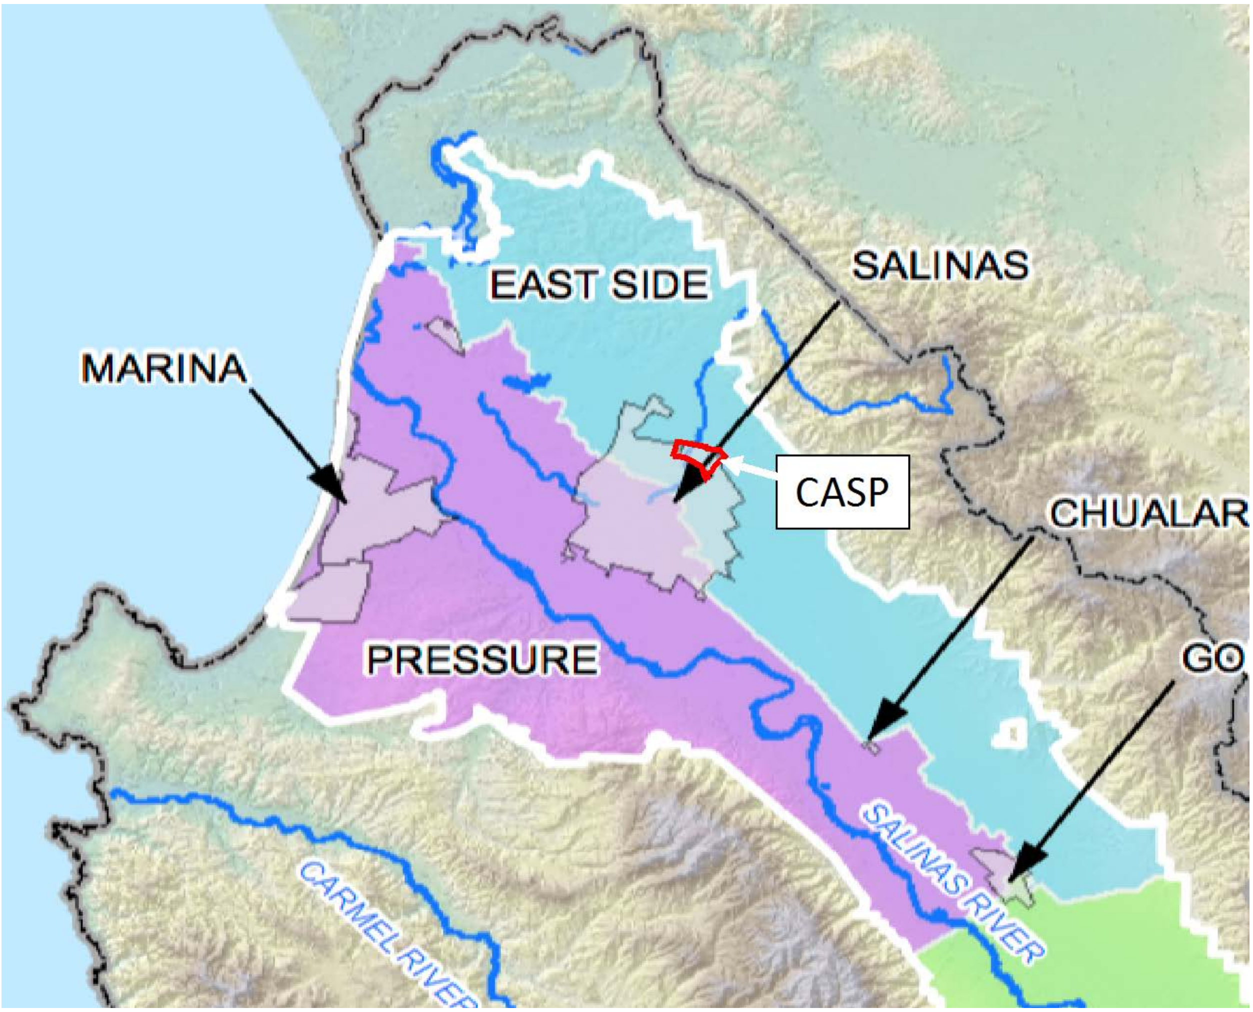

Figure 2-13 Groundwater aquifer delineations in northern Salinas Valley. CASP is located within the East Side aquifer. Source: MCWRA, 2013.

Groundwater underlying the CASP project area has direct connection to the soil surface and was measured at depths of 90-100 feet below ground surface in August 2013 (**Figure 2-14**, MCWRA, 2013; most recent publically available data). Groundwater elevations in the northern Salinas Valley have declined substantially from decades of groundwater pumping, primarily for agricultural use, including in the East Side aquifer area. Acceleration of groundwater recharge into the East Side aquifer could potentially be accomplished by diverting surplus flows in all years, and especially in wet years, onto undeveloped land areas for groundwater recharge purposes. Areas with HSG A and B soils and high infiltration rates are most ideal for use as recharge areas. Within the CASP project area, areas adjacent to Gabilan Creek (**Figure 2-3**) would be best-suited for groundwater recharge purposes, with areas directly adjacent to Natividad Creek also well-suited for groundwater recharge purposes.

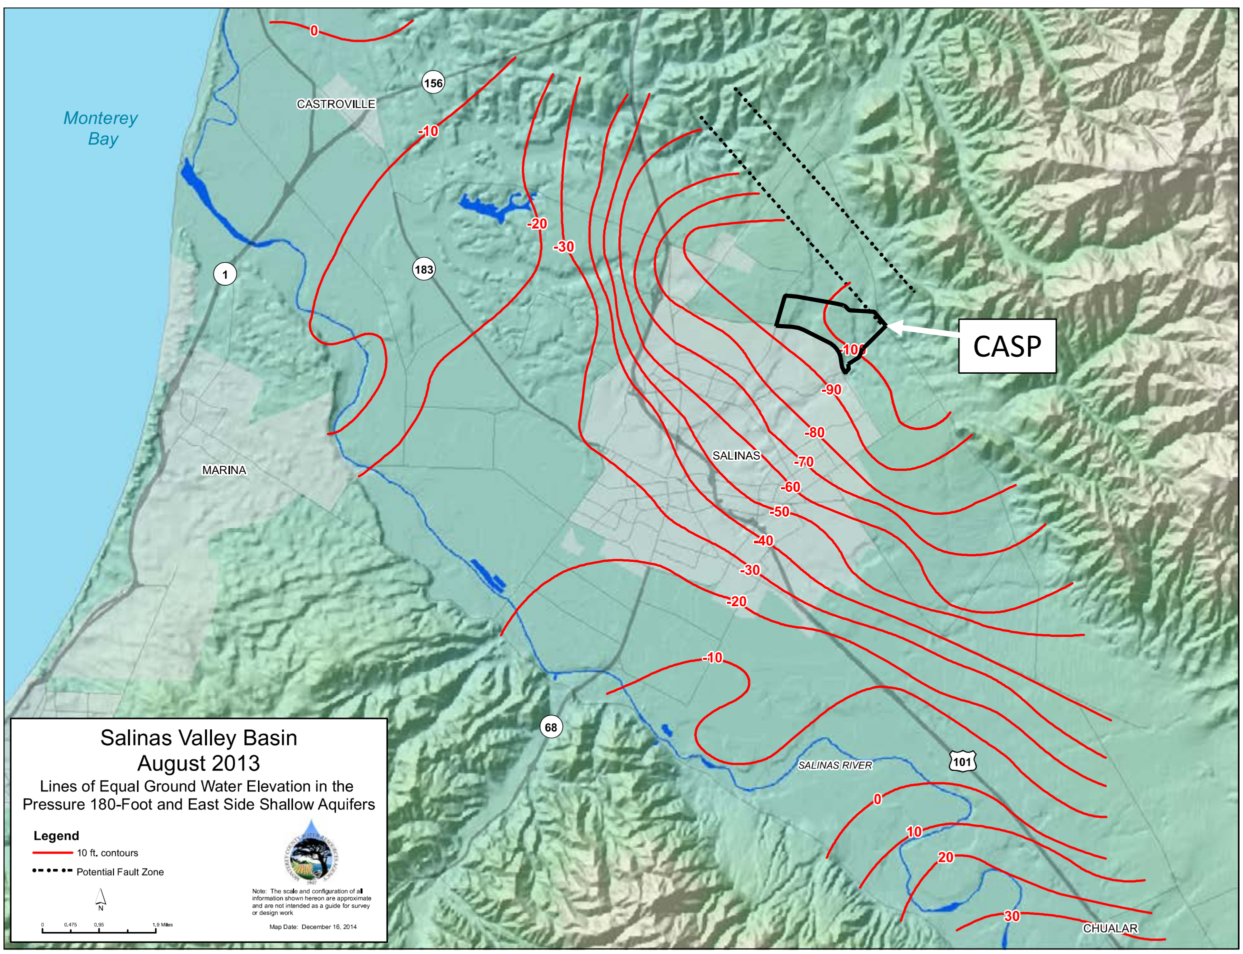

Figure 2-14 Groundwater elevations in the Pressure 180-foot and East Side shallow aquifers, August 2013. Source: MCWRA, 2013.

Groundwater pumping near coastal areas can cause seawater intrusions as fresh water is withdrawn from aquifers. The extent of seawater intrusion in the Salinas River area is to-date limited to the Pressure Aquifer west of Highway 101, and has receded in recent years (**Figure 2-15**, MCWRA, 2014; most recent publically available data). There are no impacts related to seawater intrusion on the aquifer underlying the CASP project area. However, any recharge of the aquifers via infiltration from overland flows and stream flows in the Gabilan and Natividad Creek watersheds supports groundwater quality in the underlying aquifers and helps to limit seawater intrusion to the west. Therefore, maintenance of recharge to the groundwater basin is an important priority for Salinas and the greater Salinas Valley.

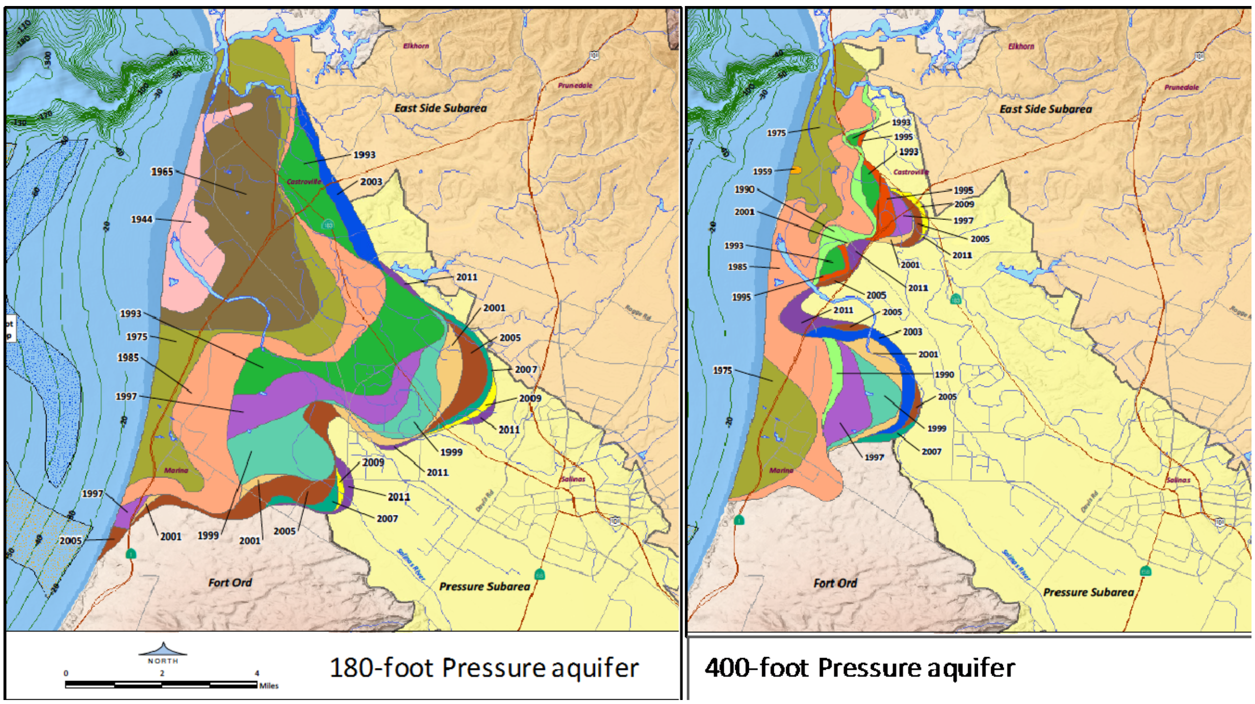

Figure 2-15 Historic (1944-2011) seawater intrusion extents into the shallow 180-Foot Pressure aquifer and deep 400-foot Pressure aquifer. Source: MCWRA, 2014.

Nitrate contamination of shallow aquifers used for water supply is a significant problem in the Salinas Valley. "Technical Report 4: Groundwater Nitrate Occurrence" (Center for Watershed Sciences, 2012) states that numerous water supply wells in the Salinas Valley have been "closed" due to nitrate contamination that exceeds the nitrate drinking water MCL (maximum concentration limit) of 45 mg/L. The report identifies rising trends in groundwater nitrate concentrations from 1978 through 2007, with some East Side nitrate concentrations increasing from 40 mg/L to 105 mg/L during that period. The California

GAMA special study (Moran et al., 2011) on nitrate fate and transport in the Salinas Valley states that geochemical and isotopic results for groundwater samples containing nitrate have a signature consistent with inorganic fertilizers, demonstrating that the primary source of nitrate contamination of Salinas Valley groundwater is agriculture.

Groundwater quality data reported in the Monterey Bay and Salinas Valley Groundwater Ambient Monitoring and Assessment study (Kulongoski and Belitz, 2007) indicates that water quality for the deep East Side 400-foot aquifer in the vicinity of the CASP plan area meets drinking water standards for all constituents except Radon-222.

The impact of agricultural and urban land uses on groundwater quality is heavily dependent on the management of those activities, including farming practices and use of Best Management Practices in urban settings to limit the addition of nitrates and other compounds to streamflows and infiltrating waters.

2.6 Surface Water Quality

Any overland flow runoff from the CASP plan area currently flows directly into Gabilan Creek and Natividad Creek via surface runoff patterns (**Figure 2-2**), evaporates, or infiltrates into soils. Both creeks flow into the Carr Lake lakebed and then pass downstream through the Reclamation Ditch system. Multiple agencies have conducted water quality monitoring within the Ditch watershed (**Figure 2-9**). CSU Monterey Bay (Casagrande and Watson, 2007) summarized water quality conditions at various monitoring sites upstream of Carr Lake in their evaluation of the potential benefits of the conversion of Carr Lake lakebed into multiple-use park space (also see Senter and others, 2017 for discussion of hydrologic constraints and opportunities associated with potential future land uses within the lakebed). Trends in surface water quality conditions include the following:

- Water quality conditions are variable, but generally are degraded by intensive agriculture and urban land uses;
- During summer and when water is present, dissolved oxygen, nutrients, suspended sediment, and fecal coliform concentrations commonly exceed established water quality objectives; and
- During winter, high suspended sediment and nutrient concentrations are common.

CSU Monterey Bay measured streamflow and water quality in the Ditch as part of their Central Coast Watershed Studies program (Inman and others, 2014). Sampling data downstream of Carr Lake were obtained from two sites; where Boronda Road intersects the Ditch and where Davis Road intersects the Ditch on the outskirts of Salinas to the west. Measurements taken between November 11 and December 2, 2014 are summarized in **Table 2-5**. Dissolved oxygen levels (DO) were robust, and salinity and TDS (total dissolved solids) were low; each indicating acceptable water quality within these parameters. High turbidity values are likely correlated to rainfall-related runoff, as would be expected (Inman and others, 2014).

Table 2-5 Summary of Reclamation Ditch Water Quality Measurements.

Reclamation Ditch
Water Quality Measurements - Mean of Samples on Dates

Location / Date	TDS (mg/L)	Salinity (ppt)	DO (mg/L)	Turbidity (NTU)

Sampling performed by CSU Monterey Bay Watershed Institute

Agricultural return flows from upstream field sources make up a portion of flows into the Carr Lake lakebed throughout the year. In yearly dry-season summer conditions, such flows may constitute most or all flows entering Carr Lake (Ballman and others, 2015). Agricultural return flows and other anthropogenic activities carry various pollutants that are detrimental to water quality. Gabilan and Natividad Creeks, as well as Alisal Creek, have listed 303(d) impairments to aquatic waters entering Carr Lake (**Table 2-6**).

Table 2-6 Listed 303(d) impairments to aquatic waters entering Carr Lake. Source: CCRWQCB, 2010.

Pollutants impairing waterbodies that enter Carr Lake.

Creek	Ammonia (Unionized)	Escherichia coli (E. coli)	Fecal Coliform	Low Dissolved Oxygen	Nitrate	pH	Sediment Toxicity	Sodium	Temperature, water	Turbidity	Unknown Toxicity
Gabilan	x		x		x	x	x			x	x
Natividad	x	x		x	x	x	x		x	x	x
Alisal			x		x			x			

Pollutants include those categorized as nutrients, pathogens, toxicity, sediment, and miscellaneous

3 PROPOSED PROJECT DESCRIPTION

3.1 Project Plan

The land use plan and proposed alignments of roads, developments, parks, schools, and runoff retention basins are summarized in **Figure 3-1**. The CASP project area contains approximately 760 acres of land, which is proposed to be utilized for 320 acres of residential development, 44 acres of mixed use commercial development, 187 acres of streets, and 209 acres of playing fields, linear parks, creek corridors, and other open spaces. Additional details regarding the project plan are provided in the City of Salinas Draft Central Area Specific Plan (CASP Draft, 2013) and in the Notice of Preparation for this EIR (CASP NOP, 2017).

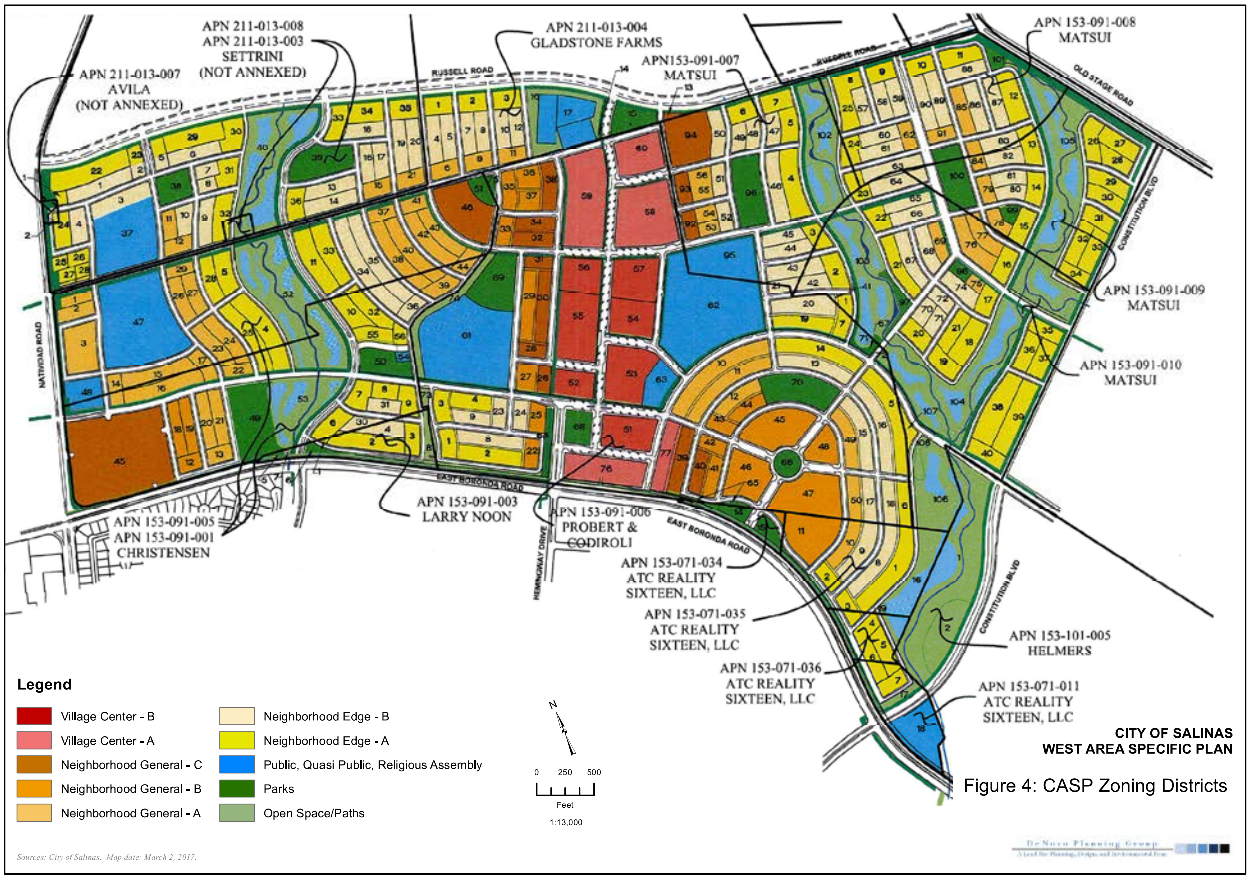

Figure 3-1 CASP proposed site plan. Source: CASP NOP, 2017.

Topography within the CASP project site will require extensive grading to create a developable site for the proposed site plan (**Figure 3-1**), especially at transition slopes between existing bluffs and at the creek corridor boundaries (**Figure 3-2**, CASP Draft, 2013). Major streets and neighborhoods will be built along constructed grading slopes. Final grading plans are expected to maintain existing overland drainage patterns and to tie in to existing conditions to the greatest degrees possible, and will be submitted to the City Engineer for review and approval prior to construction (CASP Draft, 2013). Maximum cuts and fills of up to 30 feet are anticipated, and as much as 4 million cubic yards of earth could be moved within the CASP project area. Additional details were not available to fully interpret **Figure 3-2**.

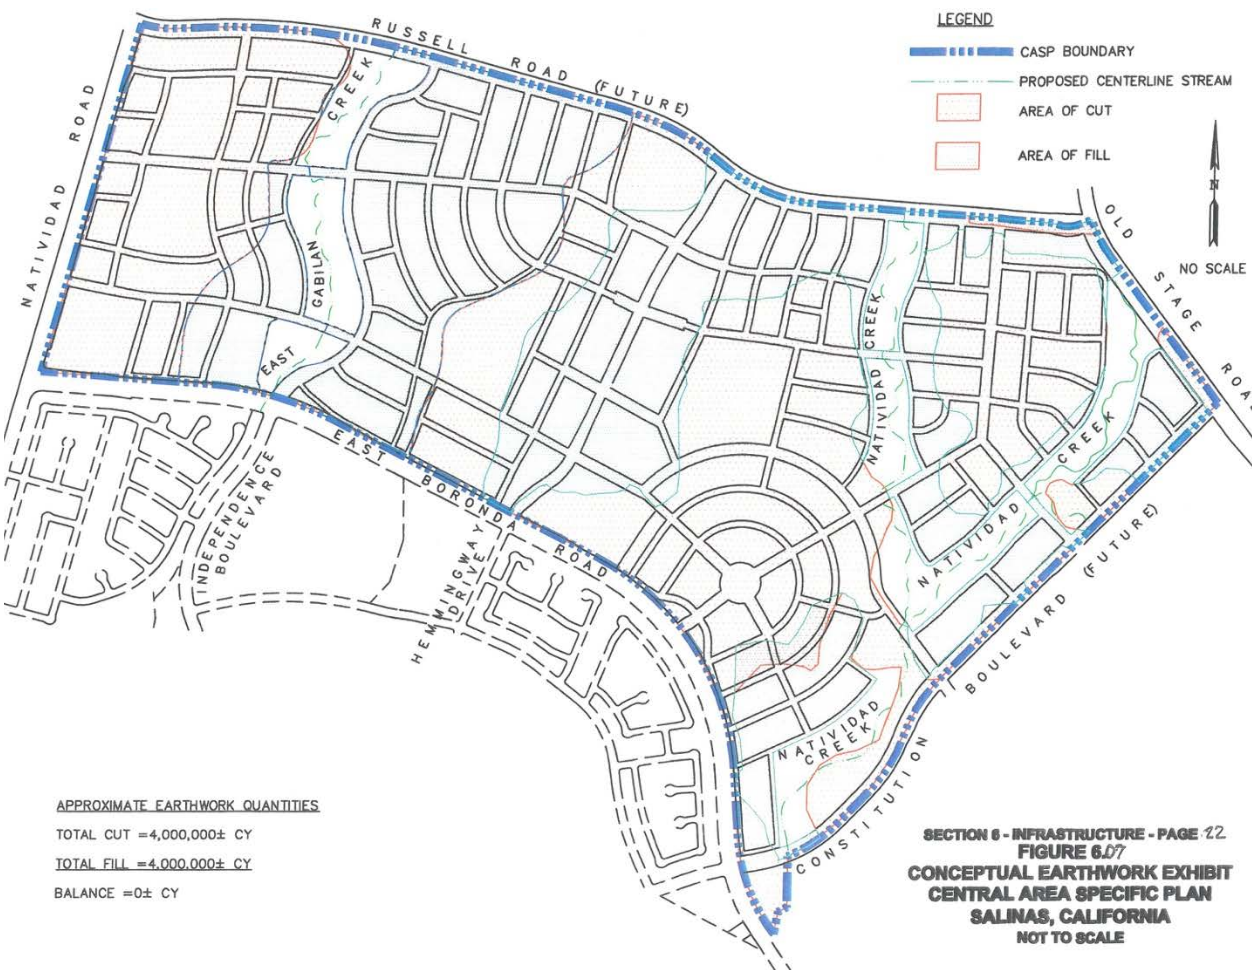

Figure 3-2 CASP conceptual grading plan. Source: CASP Draft, 2013.

3.2 Stream Corridor

Existing Gabilan Creek and Natividad Creek corridors within the CASP project area have been degraded and channelized because of agricultural operations (see **Appendix A** for supporting images). The CASP project intent is to naturalize both stream corridors and to build detention/retention/water quality basins along corridor edges that are part of anticipated improvements to existing hydrologic and ecological functions. A storm drain system will be built to convey surface runoff from the development into the corridors through a series of low impact development (LID) best management practices (BMP) features in open spaces. Other CASP project area improvements are intended to provide open space networks that include passive natural areas and active recreation and outdoor education areas (CASP NOP, 2017). Fruition of these plans would add habitat, aesthetic, recreational, storm water quality, and management value to the local setting via the creek corridors and LID BMP features.

Substantial earth grading (**Figure 3-2**) is planned within 100-year FEMA flood zones A and AE (**Figure 2-11**, **Figure 2-12**) as a means to restore and enhance the corridors to a more natural meandering, well-vegetated condition (CASP Draft, 2013) as well as to construct detention/retention/water quality basins (PACE, 2007a). Additional hydraulic studies and FEMA map revisions will be needed to ensure base flood elevations do not impact the proposed grading plans and associated development (CASP Draft, 2013).

The City of Salinas Stormwater Master Plan (SWMP, 2004) states that either a regional detention storage basin plan would be needed or that a project is required to build enough stormwater detention infrastructure to handle all needs within the project itself. The CASP project plans to develop runoff management infrastructure to handle all needs within the project itself. Basin locations in current plans are placed within the stream corridors (CASP NOP, 2017) and preliminary sizing and configuration plans have been developed (PACE, 2007a).

Detention/retention/water quality basins are proposed to be located exclusively within the restored Gabilan and Natividad Creek corridors (**Figure 3-3**). The combination detention/retention/water quality basins would be used to improve water quality, promote infiltration, store water, provide hydromodification mitigation, and avoid increases in peak storm-related flows from the CASP project area from entering the creeks and moving downstream into Carr Lake. Onsite storm drains within the CASP project site are expected to direct runoff to these facilities, which are required to maintain all existing values in runoff flow rates, volumes, and durations (SWDS, 2013; PACE 2007b) as agricultural lands are converted from pervious to impervious surfaces.

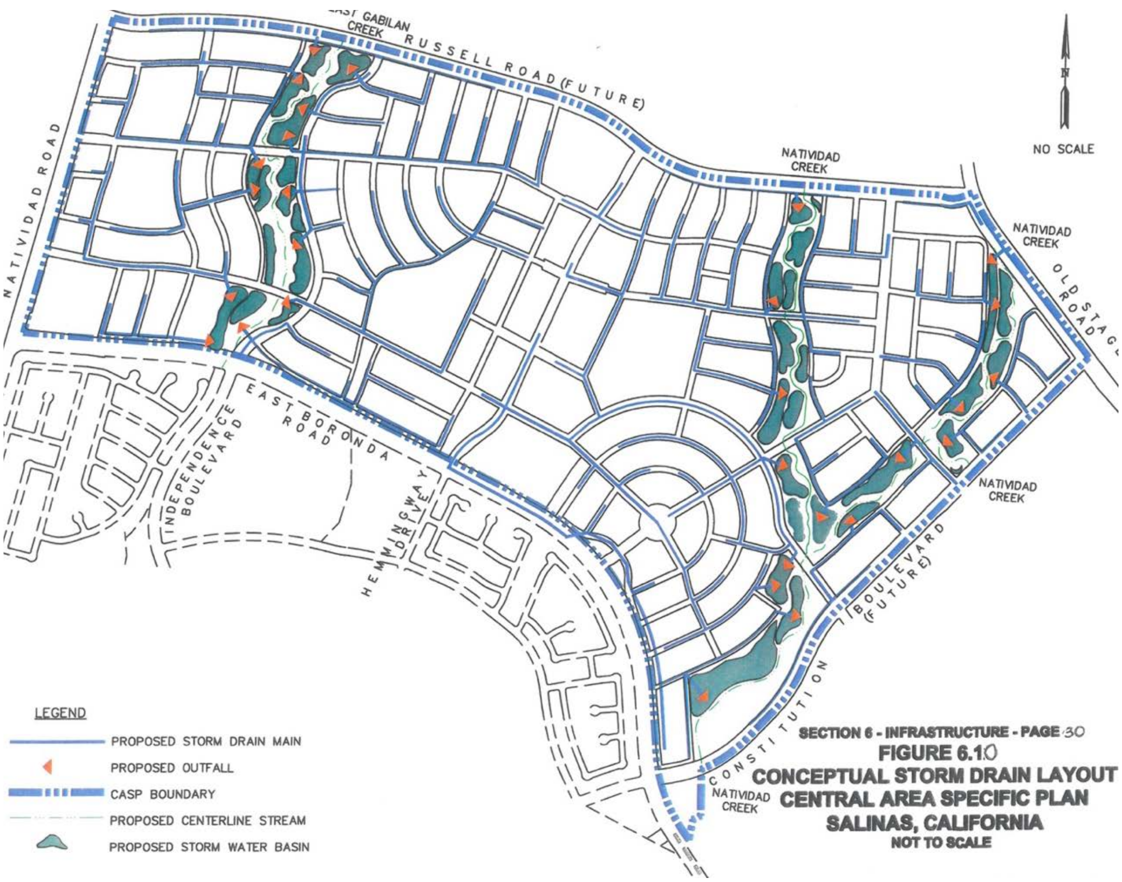

Figure 3-3 **CASP conceptual storm drain and stormwater basin plan.** Source: CASP Draft, 2013.

3.3 Drainage Infrastructure

Combination detention/retention/water quality basins are planned along both sides and much of the length of the Gabilan and Natividad Creek corridors within the CASP project area (**Figure 3-3**; CASP Draft, 2013; CASP NOP, 2017). A study and modeling of existing and proposed hydraulic/hydrologic conditions was conducted to size preliminary detention/retention/water quality basins (PACE, 2007a). The study used average rainfall depths from NOAA rainfall distributions estimates for Natividad and Gabilan Creeks, respectively, as 2.5 and 2.9 inches for a 10-year, 24-hour event, and as 4.3 to 5.1 inches for the 100-year, 24-hour event. For a 100-year 72-hour rainfall event, they used the USACE 1955 storm event of record (see Appendix B-2 in Schaaf & Wheeler, 1999), as 6.5 (Natividad), 6.4 (lower Gabilan), and 7.0 inches (upper Gabilan).

The CASP storm water drainage system will need to meet a number of requirements from the City of Salinas, the County of Monterey, and the State of California. The CASP NOP

(2017) acknowledges that these include LID requirements, water quality treatment requirements, and hydro-modification mitigation requirements. In addition to fulfilling these requirements, the CASP project intends to utilize site and parcel-based post-construction BMPs to the maximum extent practicable, to:

- maximize storm water infiltration and groundwater recharge;
- filter any storm water runoff to meet water quality requirements;
- reduce the cost of “grey” infrastructure in favor of “green” infrastructure; and
- mitigate the post-project peak storm water runoff rates and storm water runoff volumes with the intent of avoiding negative impacts to any downstream facility.

The storm water conveyance system would include an integrated network of open waterways and drains, underground storm drain pipes, detention/retention/water quality basins, and a wide range of LID and BMP features (CASP NOP, 2017). Storm drain pipelines will total roughly 25,000 feet in length (P&D Consultants, 2005).

A preliminary storm drain design was developed by P&D Consultants (2005; **Figure 3-3**), which stated that basin designs must incorporate features that provide storm water quality benefits, while still meeting flood control needs. This 2005 report also stated that, as part of the prevailing National Pollutant Discharge Elimination System (NPDES) requirements, the Permittee would be required to review existing numeric sizing criteria for structural treatment BMPs and to ensure that volume-based BMPs are designed to mitigate for potential pollutants, either through infiltration or treatment.

Preliminary detention/retention/water quality basin design plans were developed for the Natividad Creek portion of the CASP project area, with similar Gabilan Creek features to be developed later in the process. The preliminary Natividad Creek plans show basins occupying the edges of the stream corridors (**Figure 3-4**, PACE, 2007a), where inundation would be expected to occur during high flow events per preliminary modeling (**Figure 3-5**). The basins would be built as linked systems that could include water quality wetland forebays that promote sediment deposition prior to conveying flows sequentially into detention basins and retention basins which may have water quality wetlands at the inlets (**Figure 3-6, Figure 3-7**). Flows would convey through a series of passive controls and underdrains, and manual gates could be operated in certain circumstances.

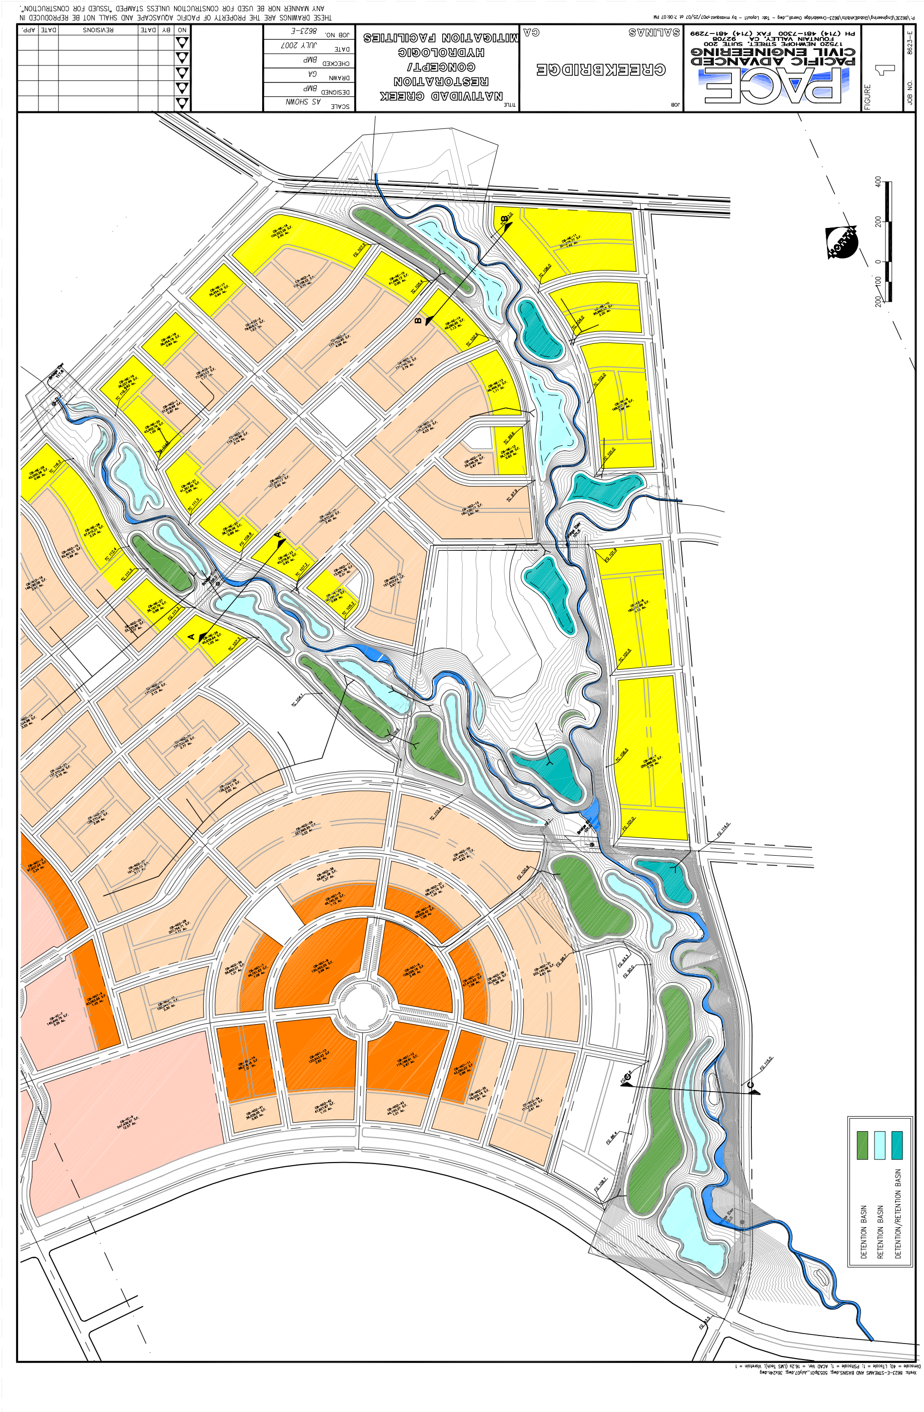

Figure 3-4 Preliminary placement of combination detention/retention/water quality basins in the Natividad Creek corridor under low flow conditions. Note that image orientation is different than other figures. Source: PACE, 2007a.

3.4 Runoff and Infiltration Management

Total average annual rainfall depth is 15.5 inches and the CASP surface area is 760 acres (CASP NOP, 2017). This yields an annual rainfall volume of approximately 980 acre-feet. Nearly all existing area is in use as agricultural fields, while the proposed project would convert as much as 60% of the area to impervious surfaces. An increase in impervious surfaces could result in commensurate groundwater recharge reduction in the range of 500-600 acre-feet. Any differences between existing groundwater pumping rates and future municipal water usage were not within the scope of this report. Under the assumption of reductions in groundwater extraction rates associated with land use changes from agricultural, a net decrease in groundwater extraction is likely to offset any potential decrease in infiltration. Moreover, detention/retention/water quality basins are proposed to be built in the creek corridors under the assumption of relatively high infiltration capabilities, which could provide an increase in total surface water infiltration into the underlying groundwater aquifer.

Any capability for the CASP project to increase groundwater infiltration rates into the local aquifer would be beneficial to the East Side aquifer and the greater Salinas region. Mapped groundwater depth below ground surface shows that CASP project location overlies the greatest groundwater surface depression (at a negative 90-100 feet) of the East Side aquifer, so additional infiltration of surface water compared to existing conditions should have a maximal impact on groundwater replenishment, making this a particularly important infiltration opportunity. It is important to note, too, that while the shallow East Side groundwater aquifer may lie up to 100 feet below the ground surface in some areas of the CASP project area, creek flows can nevertheless be a direct expression of shallow groundwater.

Earth Systems Pacific (2007) conducted soils tests within the Natividad Creek watershed area of the CASP project. They collected soil profile data at depths up to 16.5 feet from logged soil borings, performed water percolation tests on-site in holes 2 to 6 feet in depth, conducted infiltrometer tests on surficial soils to a depth of about 18 inches, and conducted lab tests for particle size distribution, hydraulic conductivity, and compaction. Overall conclusions of existing subsurface conditions included the following:

- Clay soil layers have low potential for infiltration,
- Silty, sandy, clayey soils have moderate to rapid infiltration potential,
- Recompacted soils tests in the lab yielded higher infiltration rates than relatively undisturbed *in situ* soils, with relative infiltration rates remaining constant (i.e., clays were slowest),
- *In situ* infiltration test rates were highly variable, with lower infiltration rates in compacted or irrigated areas, and
- Clay layers ranged from 1-3 feet in about half of the boring and test pit locations, but exceeded 9 feet in thickness in some areas, suggesting no consistent trend and high variability.

In relation to the needs of any stormwater control facilities, Earth Systems Pacific (2007) offered the following observations:

- Stormwater control facilities located in sandy soils would likely infiltrate water relatively rapidly, whereas rates would be slower in clays and clayey sands,

- Any silts and clays that deposit into stormwater control facilities would reduce infiltration capacities, so proper maintenance would be needed to maintain target infiltration capacities, and
- Stormwater control facilities would likely be most effective if constructed as deep as practicable to intercept sandy deposits, whether indirect or direct infiltration methods are used.

Whether permanent detention/retention/water quality basins will function over the long-term in the relatively non-cohesive fine-grained materials that currently exist within all stream corridors will need to be investigated in other iterations of the design process. Whether permanent detention/retention/water quality basins will function over the long-term in more clayey soils at depth will need to be investigated in other iterations of the design process.

PACE (2007a) conducted a series of hydraulic/hydrologic analyses for mitigation basin designs, utilizing an average saturated infiltration rate of 0.09 inches per hour based on Earth Systems Pacific (2007) infiltration test results for 31 locations in the Natividad Creek area of the CASP project (minimum infiltration rate of 0.00005 inches per hour and maximum of 1.42 inches per hour; no tests were conducted in the Gabilan Creek area). PACE (2007a) used the average saturated infiltration rate in preliminary analyses to size basins (**Table 3-1**) that would fulfill various regulatory requirements for detention, retention, and water quality components of water resource management.

Table 3-1 Summary of stormwater control facility basin storage requirements.
Source: PACE (2007a).

Basin sizing assumptions were based on field data and provide for conservative sizing results; those related to factors of safety for the maximum one-day retention volume compared to “no infiltration” indicate how important infiltration functionality will be to project success. The total area of creek corridor available for natural flows compared to the total area dedicated to the detention/retention/water quality basins was not specified, but simple estimates using available information (**Table 3-1, Figure 3-4**, **Figure 3-6**) suggest that basins will occupy about one-half to two-thirds of the proposed stream corridor area. Whether necessary conveyance capacity for upslope stream flows and necessary volumetric capacity of the detention/retention/water quality basin will be available in high flow conditions is a significant concern - particularly if some basins are inundated during larger floods. The interaction between creek flows and local stormwater flows will need to be investigated.

A set of design considerations (PACE 2007a) includes brief discussions of future needs in the next iterations of stormwater hydrologic control measures as the CASP project moves forward:

- Higher infiltration rates in the corridors as a primary motivation to site the basins within the stream corridors,
- Potential for basins to store creek flows as well as development runoff during the highest flow conditions,
- Exploration of a range of basin facility configurations,
- Importance of mosquito control,
- Importance of vegetation selection,
- Basin depths and embankment side slopes as safety considerations,
- Outlet operations and potential for clogging,
- Avoidance of basin slope erosion,
- Maintenance access, and
- Maintenance of infiltration capacities by regular removal of sediment deposition.

In addition to stream corridor detention/retention/water quality basins, LID principles are planned for implementation throughout the CASP plan area (CASP NOP, 2017), although number, locations, and sizes are not yet specified. The expectation is that developed site hydrology will be managed to the maximum extent practicable by storing, infiltrating, and detaining runoff per regulatory requirements using LIDs, BMPs, and a combination of detention/retention/water quality basins (**Figure 3-4**).

Proposed LID features would be located next to impervious areas within the plan area (**Figure 3-1**). LID features that may be utilized include pervious strips concentrated along residential streets and at driveways to disconnect developed lots from the drainage system, bio-swales, on-site bio-retention, and porous pavement (SWDS, 2013). Runoff retained in LID features would be used by plants, as well as evaporate or infiltrate into underlying soils for groundwater recharge. Underdrains piping to the storm water drainage system would be installed where soils have low permeability, to prevent extended ponding of trapped water.

3.5 Water Quality Treatment

The PACE (2007a) report identifies water quality treatment basins and how water quality basins/wetlands would work in tandem with detention/retention basins (**Figure 3-7**). Each water quality basin would include minimum standards for sizing treatment control BMPs in volume- or flow-based facilities that would detain the water quality design storm and any additional volume of runoff caused by the development above the pre-development runoff during the design event. The CASP NOP (2017) acknowledges that the potential impacts on hydrology and water quality caused by the proposed project will require additional detailed analysis and conformity to water quality regulations. As suggested by the PACE (2007a) report, the approach to water quality treatment is expected to use LID principles that include water quality BMPs. As mentioned above, locations for LID/BMPs have not yet been identified.

4 REGULATORY SETTING

4.1 State Laws and Regulations

The California Municipal Storm Water Permitting Program regulates storm water discharges from municipal separate storm sewer systems (MS4s). MS4s are defined as a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) owned or operated by a public body (i.e. city, county, etc.) designed or used to collect or convey stormwater, not a combined sewer, and not part of a publicly owned treatment works (SWDS, 2013). Under Phase I of the MS4 permit program, the California Regional Water Quality Control Board issued an NPDES permit to the City of Salinas (Permit No. CA0049981; CCRWQCB Order R3-2012-0005) which regulates development within city limits (CCRWQCB, 2012). Recognized impairments to the receiving waters include:

1. Listed impairments to the following receiving waters: Gabilan Creek, Natividad Creek, Reclamation Ditch, either within or downstream of the project area include: nitrate, ammonia, fecal coliforms, E. Coli, turbidity, priority organics, pesticides, copper, low dissolved oxygen, low pH, sediment toxicity, unknown toxicity, cholorpyrifos, and diazinon.

The NPDES permit imposes multiple regulations on the City of Salinas in operating its MS4, including the following key requirements:

- Discharges which contribute to exceedances of water quality standards and are not reduced to the maximum extent practicable are prohibited.
- Projects in future growth areas are required to manage rainfall at the source using uniformly distributed decentralized controls, natural treatment, and volume reduction BMPs (e.g., bio-retention features, vegetated swales, filter strips) as the first means of meeting stormwater management criteria.
- Erosion and sediment control BMPs shall be installed to reduce pollutant discharges from construction areas and to control ongoing sediment production from slopes and channels.
- Soil stabilization shall be implemented on disturbed areas immediately following the completion of earth disturbing activities.

- Source control BMPs shall be implemented in projects to minimize the discharge of pollutants.

Furthermore, the NPDES requires the following detention/retention/water quality capabilities for storm related runoff:

- Detention/retention of the volume of runoff from impervious areas produced from the 24-hour 85th percentile storm event, which is currently set at 0.6 inches of rainfall for the City of Salinas.

The NPDES permit identifies one Total Maximum Daily Load (TMDL) limitation, for fecal coliform concentrations in receiving waters. Based on a minimum of not less than five samples for any 30-day period, fecal coliform concentrations shall not exceed a log mean of 200 MPN/100 mL (MPN is defined as "most probable number"), nor shall more than ten percent of total samples during any 30-day period exceed 40 MPN/100 mL. Discharges to the receiving waters which cause an exceedance of this criterion must be prevented.

Finally, the NPDES permittee shall develop, update, and implement an effective stormwater pollution prevention plan (SWPPP) that identifies BMPs, standard operating procedures, inspection procedures, checklists, schedules, and records of performing these activities in conformance with the permit.

4.1.1 Groundwater Law

The importance of maintaining sustainable groundwater supplies has driven the formation of a nascent regulatory framework, as passed into law by the statewide Sustainable Groundwater Management Act (SGMA, 2014). In Salinas Valley, a mandatory groundwater basin planning process is underway. Local stakeholders have formed the Salinas Valley Groundwater Sustainability Agency with the intent to develop implementation plans for sustainable groundwater use in the Salinas Valley Basin by 2020 (SVGSA, 2017). The CASP project area will be regulated in the future through the SVGSA organization operating within the framework of the SGMA.

4.2 Local Regulations and Policies

The most current City of Salinas standards are defined in "Stormwater Standards for New and Redevelopment Projects" (SWDS, 2013), The regulations pertinent to this ADEIR, given the project size, are summarized below in **Table 4-1**. The SWDS was formally updated to incorporate requirements of the NPDES permit issued to the City in 2012.

Table 4-1 Summary of applicable City of Salinas SWDS (2013) requirements

SWDS Section	Applicable Project Impact	Limitation or specification
2.1.1	Runoff generated by projects where more than 50% of existing impervious areas will be altered	All runoff from entire project area shall be included in treatment design
2.2.1	Changes in ground surface	• Minimize impervious area • Limit disturbances of natural drainage features • Minimize compaction of highly permeable soils • Minimize clearing and grading of native vegetation
2.2.1	Pollution source control	BMPs must be applied to all impervious areas and incorporate landscaping that minimizes runoff and promotes infiltration
2.2.4	Retention of runoff from impervious areas	• When design infiltration rate is greater than 0.3 in/hr, off-site discharges from all rainfall events up to 0.98 inches of rainfall in 24 hours (95th percentile storm event) shall be prevented using retention and infiltration methods. • When design infiltration rate is less than or equal to 0.3 in/hr, a low flow control system with the capacity of no more than 0.01 cfs per tributary acre is permitted.
2.2.5	Control of peak storm flows	Post development peak storm flows shall not exceed pre-project peak flows for the 2- through 100-year rainfall events. A calibrated continuous simulation

		hydrologic model must be used to evaluate stormwater control measures.
2.3	Stormwater control plan	Plan must be submitted that addresses sizing, infiltration feasibility, and other performance calculations, and LID and BMP controls.
2.4	Operation and Maintenance plan	Plan must include procedures and schedule that will be used to maintain long-term effectiveness of flow controls and BMPs.
3.3.2.1	Proximity of BMPs to potable water wells	Minimum of 100 feet separation.
3.3.2.3	Depth from infiltration BMPs to seasonally high groundwater level	Minimum of 5 feet for indirect infiltration features and 10 for direct infiltration features, or demonstration that sufficient measures will ensure insignificant risk of groundwater contamination.
4.5.1 and 4.6	Attenuation of peak flows to pre-project conditions	• Peak flow matching up to the 100-year storm event. • Adequate mitigation of the 2-year peak flow is assumed if the 10-year peak post-project flow is reduced to pre-project discharge and if the 2-year post-project flow is less than 60 percent of the pre-project 10-year peak flow.
5.9	Detention of discharges flowing to Carr Lake	Monterey County Water Resources Agency criteria will be met.
5.9	Detention/retention facility sizing calculations	• 24-hour duration storms shall be used for detention facility sizing

		• discharge shall not exceed the available downstream capacity
6.1.4	Control of potential groundwater contamination	Only indirect infiltration (infiltration after treatment in a BMP) is allowed when there is potential for contaminant spills or transportation of contaminants from contributing areas.

Municipal ordinances related to floodplains in the City of Salinas Code of Ordinances (2017) that are pertinent to the CASP project area include information located in Sec. 9-54.3, Sec. 9-55.1, Sec. 9-55.3., and Sec. 9-55.4. The City of Salinas has established the following standards that will apply to the CASP project area:

- All new construction must be built a minimum of two feet above the base flood elevation (Sec. 9-55.1.c).
- If the site is filled above the base flood elevation, an application for a letter of map revision based on fill (LOMR-F) must be submitted to the floodplain administrator with the pertinent information (Sec. 9-55.3.a).

The Monterey County Water Resource Agency has imposed regulations for floodplains in the County, Ordinance 5139 (Monterey County Board of Supervisors, October 2009). Pertinent regulations applying to the CASP project area include those listed below:

- Lands within the FEMA FIRM identified 100-year floodplain (Special Hazards Areas) and areas within 200 feet of a river or with 50 feet of a watercourse are subject to these regulations.
- No construction is allowed within regulatory floodway Zones A or Zones AE.
- Any encroachment into a regulatory floodway shall not result in any increase of base flood elevations.
- New construction shall have the lowest floor, including basement, elevated to at least one foot above the base flood elevation (City of Salinas has a 2-foot standard).

5 STANDARDS OF SIGNIFICANCE

Under accepted criteria for assessing impacts under the California Environmental Quality Act (CEQA, 2016), the Salinas CASP project would have a significant impact with regard to hydrology and water quality if it would:

1. Violate any water quality standards or waste discharge requirements.
2. Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g. the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted).
3. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site.
4. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site.
5. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.
6. Otherwise substantially degrade water quality.
7. Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map.
8. Place within a 100-year flood hazard area structures which would impede or redirect flood flows.
9. Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam.
10. Be subject to inundation by seiche, tsunami, or mudflow.

6 PROJECT INDUCED CHANGES IN HYDROLOGY AND WATER QUALITY

6.1 Runoff and Infiltration

The proposed CASP development is expected to contain water quality BMPs based on LID principles, and detention/retention/water quality basins designed to maintain or reduce existing conditions runoff to the Gabilan and Natividad Creek channels. Changes to land characteristics from agricultural to impervious surfaces (housing, streets) will increase runoff potential. Depth to groundwater in the creek corridors compared to detention/retention/water quality basin invert elevations will be an important determination, as indirect infiltration basins are required to be 5 feet above seasonally high groundwater elevations (SWDS, 2013).

The infiltration capacity of soils varies between watersheds and from location to location, with the highest infiltration capacity located within the Gabilan Creek corridor and historic floodplain (**Figure 2-3**). Natividad Creek also contains high infiltration capacity zones within its corridor, but has less overall infiltration capacity. Infiltration capacities may change dramatically in areas impacted by extensive proposed grading, depending on what soils types are exposed, level of compaction, and what soils are placed as top soils.

The ability of detention/retention/water quality basins to infiltrate stormwater will be dependent on whether basins are situated in sandy soils or clayey soils. The ability of detention/retention/water quality basins to remain structurally sound may also be dependent on whether basins are situated in sandy soils or clayey soils. Investigations into whether both conditions can be met are needed.

Evapotranspiration (ET) has been shown to decrease when irrigated agricultural land is converted into urbanized settings (Grimmond and Oki, 1999). Existing ET, which averages about 35 inches per year (**Figure 2-8**), could decrease to as little as 20-25 inches per year and may result in more runoff routed into the local groundwater aquifer than under current conditions. If ET rates are lower and appropriately sized basins are built and properly maintained, as envisioned within both creek corridors, infiltration capacities into the local groundwater aquifer should be maintained or could potentially increase.

Results of peak and total volume runoff calculations and detention basin sizing calculations (PACE, 2007a) for predicted high flow runoff conditions appear to meet regulatory requirements for the proposed development.

6.2 Flooding

The CASP project area Gabilan and Natividad Creek corridors are subject to flooding. **Figure 2-11** indicates the extent of designated floodway Zone AE (Gabilan Creek) and Zone A (Natividad Creek). The City of Salinas Code of Ordinances (2017) standards of construction Sec. 9-55.1. states that all new construction shall be built at a minimum elevation of 2-feet above the base flood elevation (i.e., the 100-year flood elevation). An application for a letter of map revision must be filed with the City of Salinas floodplain administrator and FEMA with necessary information for approval, because of extensive grading plans for developments, and extensive grading plans within the creek corridor in support of creek channel rehabilitation and detention/retention/water quality basins. Preliminary placements of the detention/retention/water quality basins appear to conform to FEMA flood zones (**Figure 6-1**).

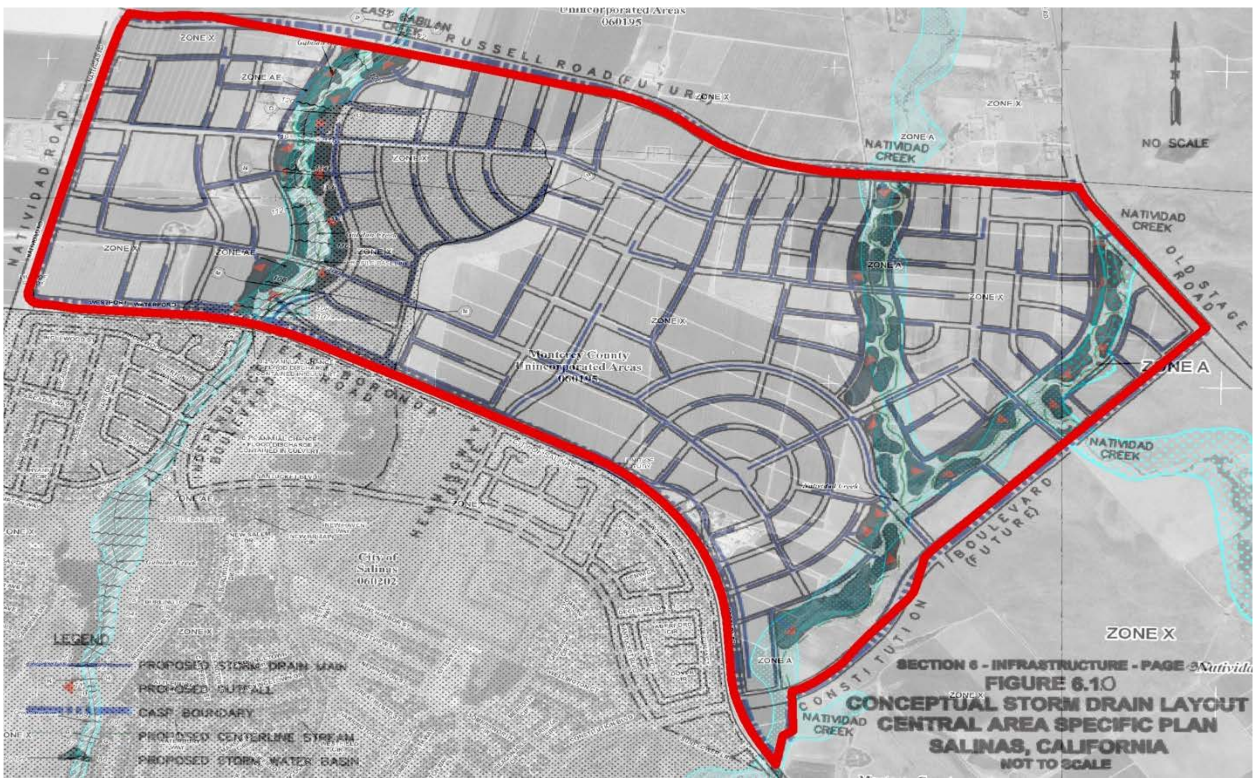

Figure 6-1 **Conceptual stormwater basin placements overlain on FEMA flood zone mapping indicates relative agreement of basin placements with FEMA Zone AE (Gabilan) and Zone A (Natividad).**

The conceptual drainage infrastructure plan for the CASP project area (**Figure 3-3**) includes storm drain piping that is intended to preserve existing drainage patterns, such that drainage is directed into the appropriate creek corridor (P&D Consultants, 2005). In addition to stream corridor basins, open space areas will contain LID BMPs as supplemental detention/retention/water quality basins. All basins are expected to have potential for infiltration and flood flow attenuation for on-site flows (PACE, 2007a).

The CASP project area will undergo extensive grading to create a developable site for the proposed site plan, especially at transition slopes between existing bluffs and at the creek enhancement corridor boundaries (CASP Draft, 2013). Maximum cut and fill of up to 30 feet are anticipated, and as much as 4 million cubic yards of earth moved within the CASP project area. Grading of this magnitude will dramatically change land elevations and has the potential to substantially change the infiltration rates of affected soils. The conceptual pattern of cut/fill is indicated on **Figure 3-2**; however, a high-resolution figure and cut/fill quantities would be needed to reliably interpret cut/fill areas but was not available for this report. As a result of extensive grading, existing flood mapping will no longer be applicable. The project applicant will be required to submit an application for a letter of map revision based on fill (LOMR-F) to the City of Salinas floodplain administrator and FEMA for approval.

Natividad basin placements (**Figure 3-4**) indicates a general minimum 300-foot wide creek corridor with some areas up to 400-500 feet wide, with no structures located within the designated floodway extents of the creek corridors other than detention/retention/water quality basins. Provided that the storm drain system and basin facilities are adequately sized, are properly installed and maintained, and do not encroach on the channel conveyance area to an extent that prohibits smooth transitions at upstream and downstream boundaries as well as within the CASP project area itself for flood and sediment conveyance, additional flooding should not be induced by the proposed project.

6.3 Discharge to Existing Waterways and Storm Drains

The proposed storm drain alignments, detention/retention/water quality basins, and use of LID principles for water quality BMPs (locations not specified) are expected to be designed to prevent any increases in low flow discharges or storm related peak discharges, and to minimize any degradation of the quality of stormwater exiting the CASP project area. Calculations related to potential changes in storm related peak discharge and total storm runoff volume are reported in PACE (2007a). Detailed sediment transport studies in both creek corridors will have to take into account off-site stormwater flows and sediment transport capacities at upstream, downstream, and in-project stream corridors (PACE 2007a,b) It will be necessary to conduct additional hydraulic studies and properly size the capacity of the rehabilitated stream corridor and stormwater control basins, particularly if much of the stream corridor is occupied by basins as currently envisioned (**Figure 3-4**).

Analyses of stormwater discharges during rainfall events have been modeled (PACE, 2007a), which provides information needed to design LID/BMP features and detention/retention basins to meet the all stormwater management and water quality management standards. Some retained water will be lost to evapotranspiration and potentially much more will be expected to infiltrate into the ground and replenish the underlying groundwater aquifer. If LID/BMPs are properly designed, reductions in runoff to storm drains across a range of rainfall-runoff events may indicate that stormwater runoff would be retained within the project area relative to existing conditions.

6.4 Surface Water Quality

Important water quality concerns for Gabilan Creek, Natividad Creek, Carr Lake, and the downstream Reclamation Ditch receiving waters currently include turbidity, nutrient, and fecal coliform concentrations. Urbanized areas tend to produce contaminants such as heavy metals, oils and greases, pesticides, nutrients from landscape fertilizers, and household chemicals that may transport into the creeks. Water quality basins associated with detention/retention basins in the stream corridor were evaluated as part of the PACE (2007a). Smaller BMPs within the development were broadly discussed but not specified by location in the project plan (**Figure 3-1**) or CASP NOP (2017). Detention/retention/water quality basins are expected to be designed to capture and retain urban-associated contaminants as well as to reduce turbidity and nutrients which may be mobilized in the developed areas or which enter the area from upstream sources. Water quality detention basins and distributed BMPs should be designed to trap suspended solids and nutrients which may enter the CASP project area from upslope properties that will continue to be farmed. If properly designed, water quality BMPs and detention/retention/water quality basins would likely reduce loadings of contaminants, nutrients, turbidity, and fecal coliforms to the downstream receiving waters relative to existing conditions.

6.5 Groundwater Quantity and Quality

Impacts to groundwater are an important consideration for the CASP development plan as well as the East Side aquifer. Salinas Valley groundwater quantities have been declining for decades, as evidenced by the substantial lowering of water levels in local aquifers because of groundwater extraction practices (**Figure 2-14**). Groundwater quality has also been degrading for decades, with nitrate loading from agricultural activities and with varying degrees of potential for salinity intrusions into freshwater groundwater supplies (**Figure 2-15**). If detention/retention/water quality basins are to be located in the stream corridors, then there is potential for depth to seasonally high groundwater to be less than 5 feet as required by SWDS (2013) section 3.3.2.3 (see **Table 4-1**) for indirect infiltration, in which case the project will have to demonstrate that sufficient measures will be employed to ensure an insignificant risk of groundwater contamination.

The BMPs proposed as part of the CASP project plan should be designed to infiltrate as much stormwater runoff as practicable into the ground (SWDS, 2013) prior to entering the storm water drain system. The expected predicted impact of the development, with appropriately designed detention/retention/water quality basins and BMPs, would be to decrease the volume of runoff from the CASP project area during large rainfall events and eliminate discharges completely for storms up to 0.98 inches in 24 hours. A portion of the detained runoff should infiltrate into the ground if the basins and BMPs are correctly installed and maintained, which should contribute to local aquifer replenishment. Evapotranspiration should also decrease (Grimmond and Oki, 1998), as a result of a change in irrigation practices from agricultural to mostly dry climate landscaping and concerted efforts to increase infiltration. Water quality basins and BMPs would be designed to trap contaminants and to beneficially make use of nutrients in vegetated swales and planted areas. Moreover, application rates of fertilizers to urbanized areas would decrease from those typically used in agriculture. The aggregate effect of the proposed development should be an increase in infiltration of stormwater runoff and a decrease in the loading of nutrients such as nitrates into the local groundwater aquifers.

7 IMPACT ANALYSIS

The Salinas CASP project could have a significant impact on hydrology and water quality if changes in hydrologic conditions and production of water contaminants caused by the proposed project are not adequately mitigated. Potential project impacts are discussed in the same order as the Standards of Significance listed in Section 5.

1. **Would the project violate any water quality standards or waste discharge requirements?**

1.1 Surface Water: There are no plans to discharge stormwaters into the existing City of Salinas storm drain system. Storm drains within the CASP project area will convey stormwaters to detention/retention/water quality basins in the creek corridors and eventually into Gabilan Creek and Natividad Creek. Waters that do not infiltrate or evaporate will be released following discharge requirements, and conveyed downstream into Carr Lake and the Reclamation Ditch system. Listed impairments of these receiving waters (CCRWQCB, 2012) include: nitrate, ammonia, fecal coliforms, E. Coli, turbidity, priority organics, pesticides, copper, and low pH. If runoff from the project site is not treated, then increases in the listed water quality impairments for these receiving waters would be likely.

The NPDES permit granted to the City of Salinas by the Central Coast RWQCB (CCRWQCB, 2012) prohibits discharges which contribute to exceedances of water quality standards and requires that source control BMPs are implemented to minimize discharge of pollutants. The permit defines one TMDL limitation for these receiving waters: fecal coliform concentrations. Accordingly, based on a minimum of not less than five samples for any 30-day period, fecal coliform concentrations shall not exceed a log mean of 200 MPN/100 mL, nor shall more than ten percent of total samples during any 30-day period exceed 40 MPN/100 mL. Untreated stormwater discharges have the potential to contribute fecal coliforms to receiving waters due to the presence of animal wastes in impervious and landscaped areas. The City of Salinas Stormwater Development Standards for New and Redevelopment Projects (SWDS, 2013) require pollution source control for all impervious areas using LID principles and BMPs.

Impact HYDRO-1: Stormwater discharges from the CASP project area, if not treated, could violate the City of Salinas NPDES permit as well as the City of Salinas stormwater development standards, and would likely contribute to violations of the receiving water TMDL for fecal coliforms.

Mitigation Measure HYDRO-1.1: The project applicant will submit for approval detailed plans and calculations for BMPs and water quality basins designed to meet the prevailing regulatory requirements and reduce contaminant loadings to receiving waters to the maximum extent practicable.

Mitigation Measure HYDRO-1.2: The project applicant will implement a long-term operations and maintenance plan designed to maintain BMP and flow controls needed to meet water quality standards to the maximum extent practicable, as specified via implementation of an SWPPP.

Impact HYDRO-2: Runoff from construction sites and activities, if not intercepted and treated, would violate the City of Salinas NPDES permit and City development standards, and would likely contribute to increased sediment and contaminant loadings to receiving waters.

Mitigation Measure HYDRO-2.1: The project applicant will implement appropriate construction activities controls, as required by regulations, to minimize runoff, erosion, and sediment mobilization. All phases of construction within the CASP project area will be carried out under criteria established in the SWPPP conforming to the prevailing Construction General Storm Water Permit.

Mitigation Measure HYDRO-2.2: During construction activities, there is a substantial risk of mobilization of sediment and soils and transport of sediment into receiving waters. The project applicant will implement the following NPDES permit requirements:

- Erosion and Sediment Control BMPs – Erosion control and sediment control BMPs shall be designed, installed, and maintained to reduce the discharge of pollutants from construction sites to the maximum extent practicable and protect water quality;
- Erosion and sediment from slopes and channels shall be controlled by implementing an effective combination of erosion control (source control) and other sediment control BMPs; and
- Soil Stabilization – Stabilization of disturbed areas shall, at a minimum, be initiated immediately whenever any clearing, grading, excavating, or other earth disturbing activities have permanently ceased.

1.2 Groundwater: The project will modify water movement across the land surface and infiltration of rainfall and runoff into the groundwater system. Local aquifers underlying the CASP project area are impacted by nitrate contamination. Groundwater in the project vicinity could be subject to increasing salinity due to existing seawater intrusion from Monterey Bay. Both impairments could affect use of groundwater for potable water supplies and for irrigation.

The project, if no means were provided to preserve infiltration capacities, would likely reduce net infiltration and reduce the beneficial effects of this fresh water supply into the groundwater system. The net impact could be an increase in build-up of contaminants in the groundwater in the East Side aquifer.

The project without mitigation will likely decrease the amount of nitrates entering the groundwater from the plan area, due to elimination of agricultural fertilizer application. Water quality basins and BMPs have the potential to add to groundwater contamination levels from other pollutant sources such as fecal coliforms if BMPs are not properly designed, sited, and maintained.

The City of Salinas SWDS (2013) states the following requirements with respect to infiltration systems, whether BPMs or detention/retention/water quality basins:

- No water wells can be located within 100 feet;
- A minimum of 5 feet for indirect infiltration, or 10 feet for direct infiltration, of separation must be maintained between infiltration basins and seasonally high groundwater;
- Site infiltration testing is required whenever a design infiltration rate is used. Maximum design infiltration rates shall be no more than half of the lowest infiltration test result;
- Borings or test pits must be used to identify seasonally high groundwater and potential shallow restrictive soil layers and/or bedrock;
- Direct infiltration is not allowed where there is potential for spills or transportation of contaminants; and
- Indirect infiltration systems (bio-retention basins, vegetated swales, pervious pavements) are allowed in all locations except where highly concentrated contaminants can be expected.

Impact HYDRO-3: Infiltration of rainwater and irrigation water from the proposed project, if not properly managed, could violate the City of Salinas stormwater development standards and contribute to increased contamination of the underlying groundwater.

Mitigation Measure HYDRO-3.1: The project applicant will use LID principles to design, site, and install stormwater basins and BMPs in accordance with City of Salinas stormwater development standards and maintenance procedures, and funding mechanisms will be established for those facilities to assure adequate performance in treating storm water and controlling infiltration into the groundwater.

Impact HYDRO-4: Placement of detention/retention/water quality basins within the stream corridors could result in an indirect infiltration interface being within five feet of groundwater levels during seasonally high flows.

Mitigation Measure HYDRO-4.1: The project applicant will need to verify that groundwater levels in the creek corridors would not rise to within five feet of basin inverts for indirect infiltration methods, would not rise to within ten feet of infiltration inverts for direct infiltration methods, or will have to demonstrate to the satisfaction of the City Engineer that sufficient measures will be in place to ensure that risk of groundwater contamination will be insignificant.

2. **Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g. the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?**

The proposed project, without mitigating features, could reduce infiltration of rainwater and runoff into the local groundwater aquifers due to substantial increases in impermeable areas. The proposed project will reduce the rate of groundwater withdrawals that support agricultural production within the project area.

Required BMPs and detention/retention/water quality basins will be designed to reduce runoff below that which occurs currently during storm events and increase infiltration of that runoff, which could increase groundwater recharge from the plan area.

The City of Salinas prefers detention rather than retention basins because of relatively low soil permeability characteristics in much of the City.

Impact HYDRO-5: The proposed project could decrease groundwater recharge, which could violate City of Salinas stormwater development standards.

Mitigation Measure HYDRO-5.1: The project applicant will design, site, and install infiltration-promoting BMPs and stormwater detention/retention/infiltration basins that satisfy City of Salinas requirements and are sufficient to assure that there is no reduction in groundwater recharge.

3. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

The proposed project is expected to implement extensive grading to create a developable site. Maximum cuts and fills of up to 30 feet are anticipated, and as much as 4 million cubic yards of earth could be moved within the CASP project area. Gabilan and Natividad Creek corridors will undergo extensive grading to re-naturalize the corridor and to install detention/retention/water quality basins along both sides of each corridor. Stormwater flows will be collected, managed, and transported via BMPs, drainage features, and storm drains to stream corridors without exposing ground surfaces to erosion or siltation.

Impact HYDRO-6: Extensive site grading, if done incorrectly, could violate the NPDES permit as well as SWDS requirements related to erosion control, and would likely contribute to increased contaminant loadings to receiving waters.

Mitigation Measure HYDRO-6.1: The project applicant will implement appropriate SWPPP procedures to minimize stormwater runoff during site grading as well as the implementation, operation, and maintenance of LID BMPs to minimize erosive runoff and sediment laden runoff as the site is developed.

Impact HYDRO-7: Sediment transport from on-site and/or off-site stormwater flows that deposit into detention/retention/water quality basins along the corridors could impact the ability of the basins to function adequately and/or the stream to adequately convey all flows.

Mitigation Measure HYDRO-7.1: The project applicant will implement appropriate operations, maintenance, and SWPPP procedures to ensure that the potential for siltation of basin floors, which could lead to reduced infiltration capacities, is minimized.

Mitigation Measure HYDRO-7.2: The project applicant will implement appropriate boundary sediment controls and management plans so as to minimize the potential for destabilization of the in-project or downstream channel due to excessive sediment generation or deposition from off-site or on-site sources.

4. **Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?**

Surface runoff from the area will be managed via flow reducing BMPs and detention/retention/water quality basins to prevent local flooding within the site. These features will be designed to reduce peak flows from the plan area into Gabilan and Natividad Creeks to less than such flows under existing conditions.

Impact HYDRO-8: If geomorphic, hydraulic, and hydrologic principles are not taken into consideration and features are not properly designed, restoration of stream corridors in the project area, including placement of detention/retention/water quality basins within the creek corridors, could result in an increase in the rate or amount of flooding either on- or off-site.

Mitigation Measure HYDRO-8.1: The project applicant will submit for approval detailed hydraulic/hydrologic plans, calculations, and design basis reports for any creek corridor restoration plans.

Mitigation Measure HYDRO-8.2: The project applicant will submit for approval detailed stormwater control modeling, calculations, and supporting documentation for proposed detention/retention/water quality basins within the creek corridors.

Mitigation Measure HYDRO-8.3: The project applicant will demonstrate that sufficient measures will be in place to ensure that foreseeable risks associated with placing detention/retention/water quality basins within the creek corridors are minimized to the extent practicable, and that all regulatory requirements will be met.

5. Would the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Stormwater runoff from the project area will be managed via detention/retention/water quality basins and flow reducing BMPs. Preliminary hydrologic mitigation requirements and design procedures, including typical creek corridor widths and depths, and detention/retention/water quality basin sizing calculations, have been completed but BMP designs have not been completed. Within the creek corridors, detention/retention/water quality basins may occupy from one-half to two-thirds of the proposed corridor footprint.

Impact HYDRO-9: Stormwater runoff from the project area, if not managed via detention/retention/water quality basins and flow reducing BMPs, would likely increase peak flows and total runoff volume to receiving creeks to amounts greater than such flows under existing conditions.

<u>Mitigation Measure HYDRO-9.1:</u> The project applicant will submit for approval detailed plans and calculations for detention/retention/water quality basins and flow reducing BMPs designed to meet all regulatory requirements.

Impact HYDRO-10: Stormwater discharges from the project area, if not treated, would likely create additional sources of polluted runoff that are common to urbanized areas with creation of impervious area and the production of urban-related contaminants.

<u>Mitigation Measure HYDRO-10.1:</u> The project applicant will submit for approval detailed plans, calculations, and supporting documentation for water quality BMPs and water quality basins designed to prevent to the maximum extent practicable the creation of new sources of polluted runoff.

Impact HYDRO-11: Downstream conveyance systems, including City of Salinas stormwater drainage system, Carr Lake, and the Reclamation Ditch, have little to no available excess capacity, so any increase in peak flows during major storm events could exceed existing capacities.

<u>Mitigation Measure HYDRO-11.1:</u> The project applicant will submit for approval detailed plans and calculations for detention/retention basins designed to meet the

all regulatory flow detention and release requirements so as to prevent any negative impacts to the existing downstream conveyance systems.

6. Would the project otherwise substantially degrade water quality?

No impact. Potential degradations in water quality due to the proposed project were addressed in response to Impact Analysis Questions 1 and 5, above. All mitigation measures as discussed will be designed to prevent any additional degradation to water quality.

7. Would the project place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

The project plan identifies restoration to a more natural creek corridor in the areas currently identified as flood hazard Zone AE on Gabilan Creek and Zone A on Natividad Creek, with detention/retention/water quality basins to be installed and operated along the lateral boundaries of the corridor. Grading plans identify substantial in-fill in the flood hazard area shaded Zone X to prepare for mixed-use development plans that will include housing.

Impact HYDRO-12: Flood hazard Zones AE and A are identified along the two creek corridors within the CASP project area. If grading is not properly carried out and housing were to be placed within these boundaries, those housing units could be subject to flooding.

Mitigation Measure HYDRO-12.1: The project applicant will need to submit an application for a letter of map revision based on fill (LOMR-F) to the City of Salinas floodplain administrator and FEMA with pertinent information for approval that indicates no building construction will take place within remapped FEMA flood zones AE and A.

Impact HYDRO-13: Shaded Zone X, a special flood hazard area, is located in the Gabilan Creek watershed, east of and adjacent to the existing creek corridor. If housing were to be placed within these boundaries, those units could be subject to flooding.

Mitigation Measure HYDRO-13.1: The project applicant will submit for approval detailed grading plans and calculations designed to place enough fill onto the shaded Zone X area as to raise the land surface elevation above the base flood elevation so that flooding hazards become negligible. The project applicant will need to submit an application for a LOMR-F to the City of Salinas floodplain administrator and FEMA with pertinent information for approval.

8. Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

A series of detention/retention/water quality basins are proposed to be built along the lateral edges of restored creek corridors and may take up 50-66 percent of the proposed corridor space within existing Zones AE and A. Existing corridor sediments in flood Zones AE and A are primarily sandy materials with high infiltration capacities. The basins would function as stormwater and low flow receiving basins for all flows generated by the project area. Some basins could be overtopped and inundated during certain high flow runoff conditions by flows from upstream locations.

Impact HYDRO-14: If not properly designed, implemented, and maintained, a naturalized creek corridor that is largely bounded by detention/retention/water quality basins could result in flood flow impedance or redirection.

<u>Mitigation Measure HYDRO-14.1:</u> The project applicant will submit for approval detailed plans, calculations, and design basis reports for creek corridor restoration, including detention/retention/water quality basins, within the flood hazard extents identified as Zones A and AE that provide assurances that during large storm events, creek flows and sediment transport from upstream sources are not impeded at the same time as when the adjacent basins are at or near capacity.

<u>Mitigation Measure HYDRO-14.1:</u> The project applicant will provide sufficient supporting documentation and calculations to address sediment transport issues at the downstream boundaries of the project area to the extent practicable.

Impact HYDRO-15: Sediment transport of fine-grained materials from upstream and local sources could clog infiltration capacities and could fill required storage space within the stormwater basins.

<u>Mitigation Measure HYDRO-15.1:</u> The project applicant will provide sufficient supporting documentation and calculations prior to construction that risks associated

with reduction of infiltration capacity in the detention/retention/water quality basins will be minimized to the extent practicable.

Mitigation Measure HYDRO-15.2: The project applicant will provide operations, maintenance, and SWPPP procedures such that any detention/retention/water quality basin issues associated with sedimentation or loss of infiltration capacities are promptly and adequately addressed.

Impact HYDRO-16: The non-cohesive nature of corridor sediments could result in embankment side slope failures of the detention/retention/water quality basins that are proposed to be located along the lateral extents of each creek.

Mitigation Measure HYDRO-16.1: The project applicant will provide sufficient supporting documentation and calculations that risks associated with basin embankment side slope failure because of the non-cohesive nature of Gabilan and Natividad Creek corridor sediments will be minimized to the extent practicable.

Mitigation Measure HYDRO-16.2: The project applicant will provide operations, maintenance, and SWPPP procedures such that any detention/retention/water quality basin issues associated with embankment side slope failures are promptly and adequately addressed.

9. Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

No impact. No levees or dams exist in the vicinity of the CASP project area. Portions of the Salinas Valley have been identified as subject to flood risk due to failure of the San Antonio or Nacimiento dams, which are located in the upper reaches of the Salinas River watershed. The elevation of the project area and its distance from the Salinas River channel make it highly unlikely that failure of either dam or failure of any of the levees located along the Salinas River channel would cause flooding.

10. Would the project be exposed to a risk of inundation by seiche, tsunami, or mudflow?

No impact. Tsunami inundation maps for the area (CEMACGS, 2009) show no risk of tsunami inundation for the project area. No water bodies that could produce seiche-related inundation are in the vicinity of the project area. No information regarding mud flow potential in the project area was found. Grading plans for the project include reduction of steep slopes within CASP project area thus minimizing potential for unstable slopes and mudflows. The site is elevated sufficiently above sea level to preclude any risk of inundation due to sea level rise.

APPENDIX A

Geomorphic Assessment of Gabilan and Natividad Creeks

MEMO

To: De Novo Planning Group

From: Anne Senter, Ben Roberts

Date: September 1, 2017

Subject: Geomorphic Assessment of Gabilan and Natividad Creeks

Introduction

In support of the Salinas Central Area Specific Plan (CASP) Environmental Impact Review (EIR) process, Balance staff members conducted a field site visit on April 20, 2017 of the Gabilan and Natividad Creek channel corridors within and adjacent to the CASP project area. This addendum to the Hydrologic and Water Quality chapter of the EIR is intended to identify pre-project conditions upstream of, within, and downstream in the creek corridors associated with the CASP project (**Figure 1**).

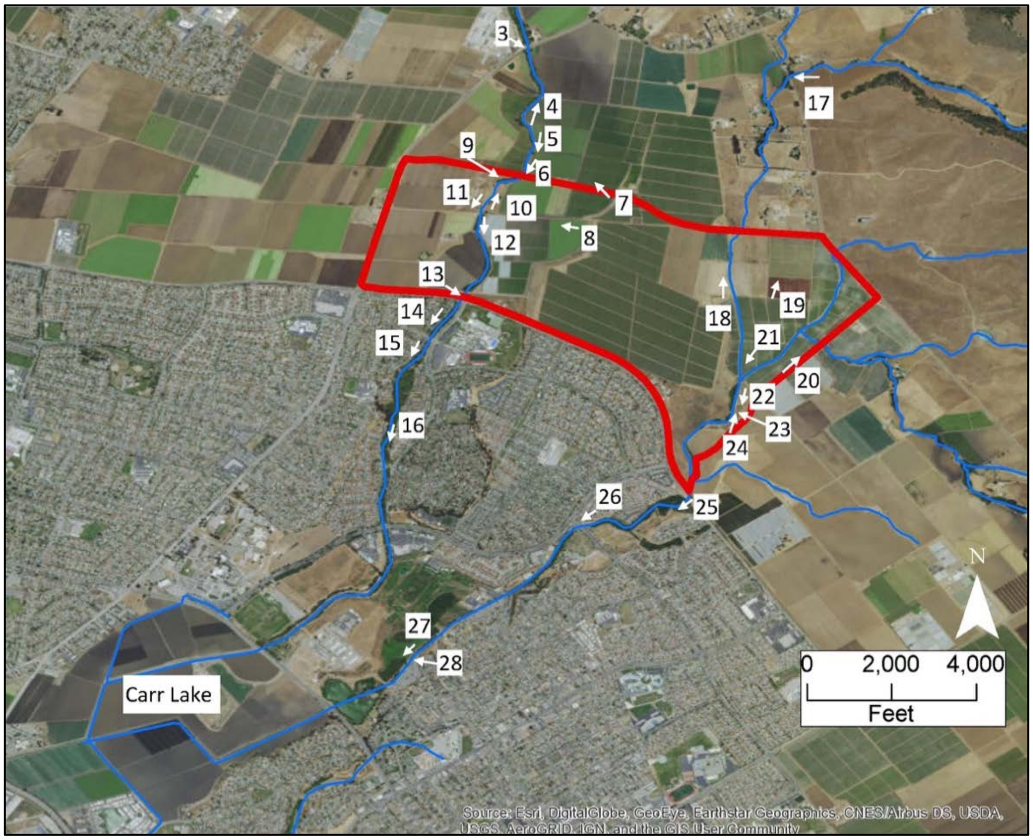

Figure 1 Photo locations of images described in this memo.

Existing creek channel conditions for Gabilan Creek and Natividad Creek are briefly described next, and then an overview of historical conditions from about 100 years ago are included for initial context. Thereafter, captioned photos provide a narrative of existing conditions observed during field reconnaissance efforts for Gabilan Creek and Natividad Creek.

Field Observations

Observations recorded in the field indicated that both creeks were dynamic in response to the prevailing wet winter climate conditions and rainfall-runoff patterns of the wet winter of 2016-2017 (water year 2017). This dynamism was expressed by variations in discharge and sediment transport loads, which were in evidence as high water marks (indicating the highest flows of the season; **Figure 3**, **Figure 9**, and **Figure 12**), overbank sediment deposition (**Figure 11**, **Figure 17**, **Figure 22**, and **Figure 23**), and channel braiding behavior (**Figure 10**, **Figure 15**, and **Figure 25**). These observations indicate the noticeable effects of abundant rainfall, runoff, and sediment transport associated with high flows in.

Under existing conditions, both creek corridors within the CASP project area are heavily impacted as a result of agricultural practices that include channelization of the creeks. Agricultural fields and service roads border the channel banks (**Figure 4**, **Figure 5**, **Figure 6**, **Figure 18**, **Figure 20**, and **Figure 22**) in many places, and in these areas riparian vegetation may be absent. Where riparian corridors are present, root structures increase soil cohesion and provide additional stability to channel banks. Areas without riparian vegetation have less cohesive banks, leading to higher degrees of braiding behavior where lateral space allows (**Figure 10** and **Figure 11**).

In the Gabilan Creek corridor, sediment loads consist of fine-grained sandy-silty materials that formed mid-channel bars in some locations, exhibiting braided channel behavior indicative of drainages with abundant fine sediment sizes (**Figure 14** and **Figure 15**). Sediment sizes in Natividad Creek are even finer, consisting primarily of silty-sandy materials (**Figure 23**). The Natividad Creek corridor within the CASP project area is more confined than Gabilan Creek, naturally as well as a result of agricultural practices, so bar behavior was less evident. However, downstream of Boronda Road, once the channel was not confined (**Figure 25**), formation of instream bars and braiding behavior were evident in this system.

Field estimates of channel geometry and flow velocity observed on the day of reconnaissance indicate that Gabilan Creek flows were on the order of 10 ft^3/sec (**Table 1**), whereas Natividad Creek flows were about 2 ft^3/sec downstream of the tributary confluence in the CASP area (**Figure 21**). On Gabilan Creek, measurements were taken at **Figure 10** and **Figure 11** and on Natividad Creek measurements were taken at **Figure 21** and **Figure 22**.

Table 1 Flow characteristics.

	Gabilan Creek		Natividad Creek	
	Baseflow	**Flood flow**	**Baseflow**	**Flood flow**
Width (ft)	12.5	150	3	60
Depth (ft)	0.3	3	0.4	3
Velocity (ft/sec)	2.5	5	1.7	5
Discharge (ft^3/sec)	9.4	2250	2.0	900

Notes:

Baseflow was measured using the float method in the field

Flood flows were approximations using high water mark observations obtained in the field

Evidence of overbank flows were visible within both creek corridors. Gabilan Creek contained abundant organic materials (mostly dead branches) lodged onto the upstream side of riparian vegetation (**Figure 9**) and along a fence line. These materials provide the evidence for the highest flows of a water year and are termed “high water marks” (HWM). HWMs and overbank sediment deposition (**Figure 11**) provide evidence of flow depths during the largest flood events of the season. Natividad Creek contained fewer HWMs (however, see **Figure 28**), but showed ample signs of overbank sediment deposition (**Figure 22**). Based on field estimates of HWMs left by the largest flows of the winter season on each creek, the highest flood flows of the winter were also estimated (**Table 1**).

Differences in watershed size and elevations are likely responsible for most of the variance between estimated baseflow and flood flows (**Table 1**). Gabilan Creek to the CASP downstream boundary is about 40.3 sq. mi. (PACE, 2007) in area compared to Natividad Creek to the CASP downstream boundary at 9.3 sq. mi. (PACE, 2007), so Gabilan Creek watershed is four times larger than Natividad Creek, with commensurately more runoff potential. Likewise, the highest elevation in Gabilan Creek is about 3,100 feet above mean sea level at Fremont Peak, whereas Natividad Creek originates in the lower foothills at an elevation of 1,420 feet (Senter and others, 2017). More total rainfall across a larger watershed area means that Gabilan Creek flows likely persist longer and at higher rates than Natividad Creek. However, it is important to note that the highest flows in each rain event could potentially be relatively equivalent through the CASP project area, as soil conditions in Natividad Creek indicate higher runoff potential.

Within the CASP project area, the overall condition of Gabilan and Natividad Creeks are highly impacted systems, incised, channelized, and managed as drainages through agricultural fields, that nevertheless continue to exhibit dynamic behavior and contain discontinuous, remnant riparian corridors. Significant changes to the channels are expected with development of the land from agricultural to urbanized, so it will be necessary that creek corridor design bases and proposed conditions modeling be conducted with proposed grading plans to best plan for potential flood hazards, stormwater flows, and other hydrologic and hydraulic project needs.

Historical Conditions

A historical soils map (**Figure 2**, Carpenter and Cosby, 1925) provides evidence that Gabilan Creek had a wide lateral extent through which high flows spread out especially in wet years. A closer look shows two stream traces, one in the Hanford sand (Hs) and the other in the Dublin clay loam (Da) portion of the stream corridor. The stream traces do not show a connection into the Hanford very fine sand (Hv) soils leading to Carr Lake, highlighting the ephemeral nature of the flow regime in this watershed. The stream trace in Da soils is shown terminating into a peaty soils (P) area, suggesting a recurrent ponding area where vegetation thrived, died, and accumulated in moist conditions for many years. There is a stream trace to the west that rises out of the Chular sandy loam (Ch) indicating shallow subsurface flows emerging from the alluvial fan. Downstream of the Hv soils wetlands extend to Carr Lake. These observations are indicative of a wide channel/floodplain of interconnected surface-subsurface flows.

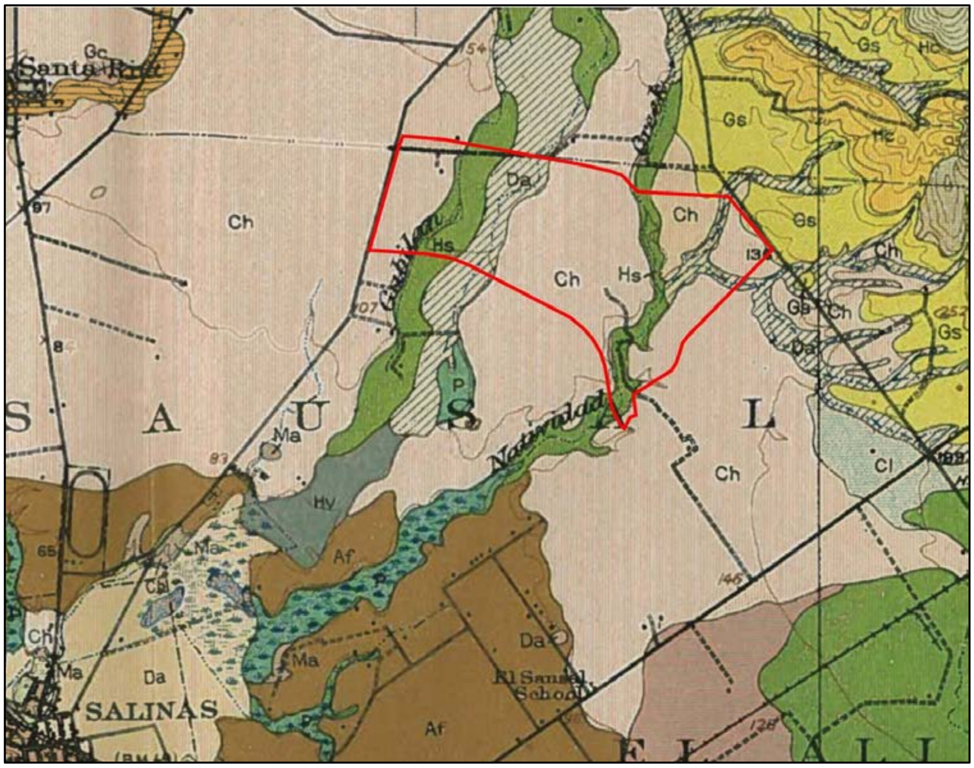

Figure 2 Approximate CASP project area location drawn onto soils map from 1925 Symbols: Hs = Hanford sand, Da = Dublin clay loam, Ch = Chular sandy loam, P = peat, Hv = Hanford very fine sand, Af = Antioch fine sandy loam. Wetlands (called swamp in 1925) are illustrated with vegetation symbols at the lower ends of both creeks. Carr Lake is located where "Salinas" is written, consisting mostly of Da soils. Source: USDA soils map, Carpenter and Cosby, 1925.

Natividad Creek is much narrower in its lateral extent. The corridor exhibits similar soils characteristics, with a predominance of Hs soils along the northwesterly mainstem and Da soils along the primary tributary from the east. Creek traces show a regular connection along the corridor until termination into a swamp/wetlands area that begin farther away from Carr Lake, indicating persistent subsurface flows associated with Natividad Creek.

Existing Conditions

1. <u>Gabilan Creek Corridor</u>

The Gabilan bridge on Natividad Road is upstream of the CASP project area. **Figure 3** indicates that a large quantity of fine-grained sediment has deposited upstream of and under the bridge.

Wood and other organic material deposition can be seen upstream of the bridge along with growing vegetation. The high-water mark is ~2 feet above deposited sandy-silty sediments, as indicated by a HWM line on the bridge bents that is difficult to see in the shadows of this image.

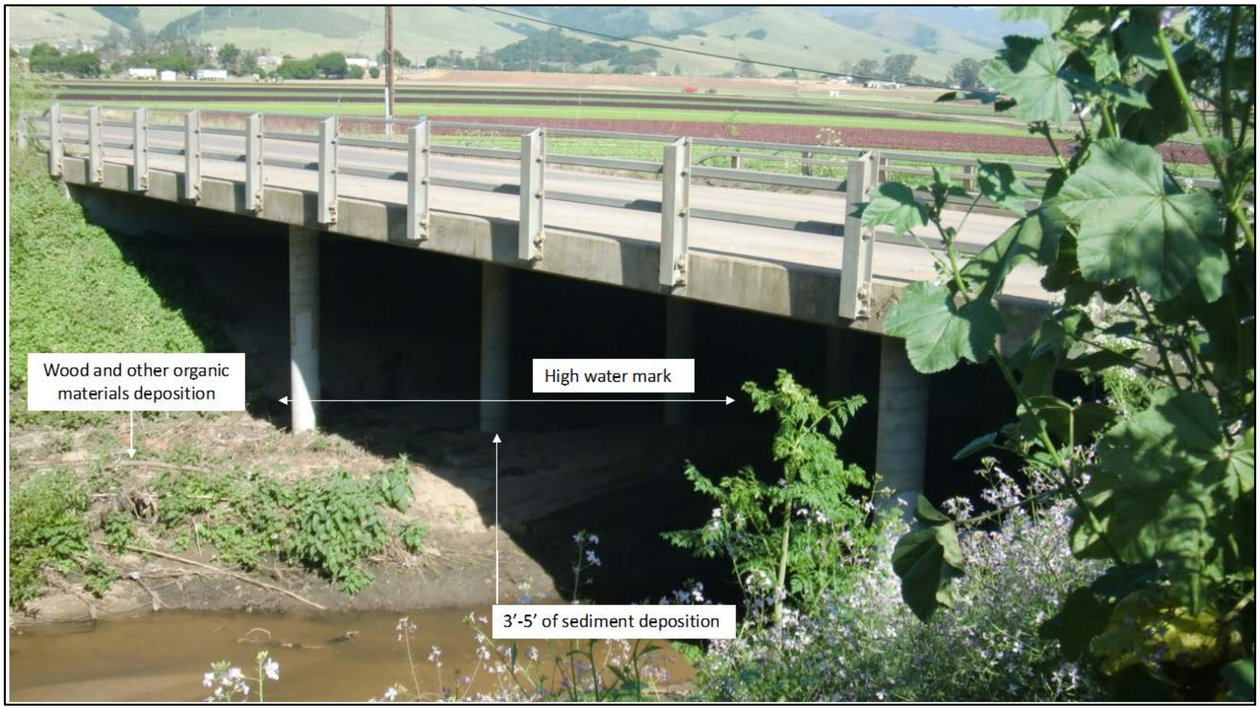

Figure 3 *Gabilan Creek at bridge on Natividad Road with distinct indicators of high flow events experienced by the region in the 2016-2017 wet winter season. Downstream to the right.*

Figure 4 is within the CASP project area, looking upstream and north of the CASP project area. Gabilan Creek in this area runs alongside a winding hillslope and supports a riparian corridor along its right bank (as defined when looking downstream) whereas the left bank is encroached upon by agricultural fields and a service road. The sediment fence was likely torn out and service road was inundated during the highest winter flows, and the roadway/fencing rehabilitated for use during planting. Note small sand bars in the channel, an indication of fine-grained sediment braiding behavior.

Figure 4 Looking north and upstream along Gabilan Creek. The creek is bounded by a hillslope on the right bank with trees, and by an agricultural service road on the left bank.

Figure 5 provides a strong indicator of the erosive power of high flows. This tree fell at an unknown location most likely from the right bank riparian corridor. The dead leaves provide an indication that the tree was uprooted during the 2016-2017 wet winter season; long enough for leaves to brown but not long enough for leaves to fall off the branches. The tree was likely transported as suggested by the position of the rootwad on the left bank edge (definitely not where it fell from); perhaps just a small distance but that remains unknown.

Figure 5 Dead tree newly recruited into the Gabilan Creek channel over the 2016-2017 wet winter season, looking downstream.

Figure 6 was taken looking downstream, and shows a much smaller tree that was uprooted from a channel bank and deposited into the channel. Even small obstructions such as this can provide the necessary roughness elements that promote slower velocity zones where transporting sediment can settle out of the water column. This process can be seen here just downstream of the dead tree where sand bar braiding has formed as a direct result of the variance in flow velocities promoting sediment deposition in the lee (downstream) of the tree.

Figure 6 Service road and fields along left bank and riparian corridor on right bank, looking downstream. Vegetation was uprooted, transported, and deposited across the channel. Sand bar downstream of vegetation is an indication of sediment transport and depositional processes in this area.

Figure 7 is looking northwesterly toward Gabilan Creek, from the elevation divide which rises between the Gabilan and Natividad Creek watersheds. The treeline in the background indicates Gabilan Creek. The fields in the foreground indicate the extent of the historical natural floodplain (also see **Figure 2**). **Figure 8** is also looking west toward the treeline indicating Gabilan Creek. The rise in the foreground is an indication of the low-lying hillslope that separates Gabilan Creek from Natividad Creek, reworked into service roads to support agricultural needs.

Figure 7 *Looking northwesterly across the historic Gabilan Creek alluvial fan, channel identified by riparian tree line. Upstream is to the right.*

Figure 8 *Looking west across the historic Gabilan Creek alluvial fan, channel identified by riparian tree line. Upstream is to the right.*

Figure 9 provides evidence of the highest flows of the 2016-2017 wet winter season. Flows were on the order of 4 feet above the current wetted channel elevation. Woody materials consisted mostly of broken branches in a range from 1-10 inches in diameter, and inches to multiple feet in length.

Figure 9 *Streamwood and sediments transport downstream during flood conditions. Streamwood has collected on the upstream side of stream-edge riparian trees, providing an indication of how deep water was in this area. The stadia rod showed flows were about 4 feet*

Figure 10 is looking upstream at an area of the creek that is not confined, is not set against the hillslope, and has no riparian corridor. This image indicates that when riparian vegetation is not present, the fine sediments produced by this watershed combined with grassy vegetation are not strong enough to hold banks in place, and as a result, the stream corridor expands. Therefore, high flows had a chance to spread out because they were not confined, which over the past winter resulted in sediment deposition across perhaps as much as 200 feet of floodplain adjacent to the creek in this particular area (measured as approximately 100 feet on the left bank and estimated as equivalent on the right bank).

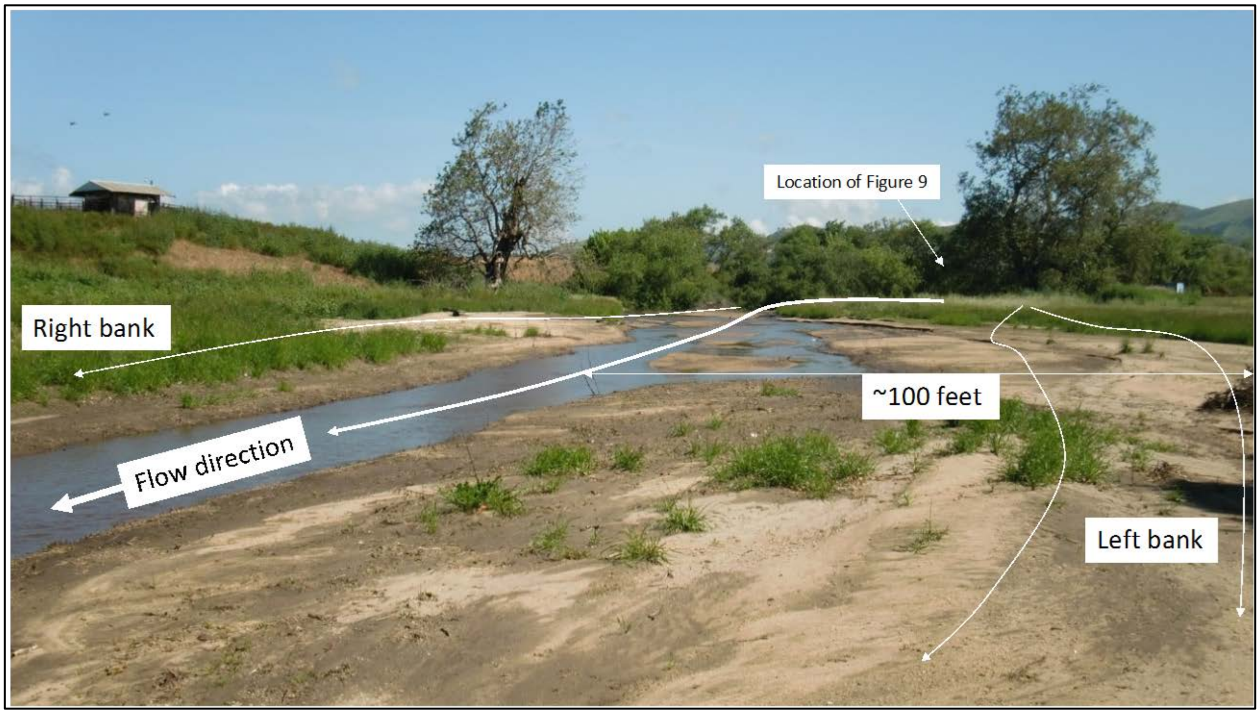

Figure 10 Looking upstream. The channel expands in width when the left bank is not confined by fields and service roads and moves away from being directly against the hillslope on the right bank. High flows may have spread more than 200 feet wide across this open

Figure 11 shows the Gabilan Creek channel when looking downstream from the position of the worker who took the upstream perspective image in **Figure 10**. **Figure 11** provides evidence of at least four stages of flow experienced by the creek over the 2016-2017 winter season. Starting from left to right, (A) provides an indication of the highest flows of the year. A substantial amount of sediment was deposited where flows could expand laterally onto the floodplain, where velocities can slow enough for sediments to drop from the water column. This process illustrates just what functioning floodplains do: provide locations for sediment deposition during flood conditions. The arrow perpendicular to creek flows labeled "hillslope runoff" indicate flows from the upslope area after (A) sediments were deposited. The (B) delineation shows a second flow event that was smaller than the (A) event, carving a new lateral extent from the higher flow deposition. The sediments deposited in this event appear to have contained grass seeds that have flourished. The (C) delineation shows another set of flows that scoured out sediments such that grasses are not growing in this area. Finally, (D) shows the current low flow wetted channel, which in many years with less total rainfall would contain lower flows, or potentially no flows, at this time of year (see **Figure 1** and that discussion of more natural conditions).

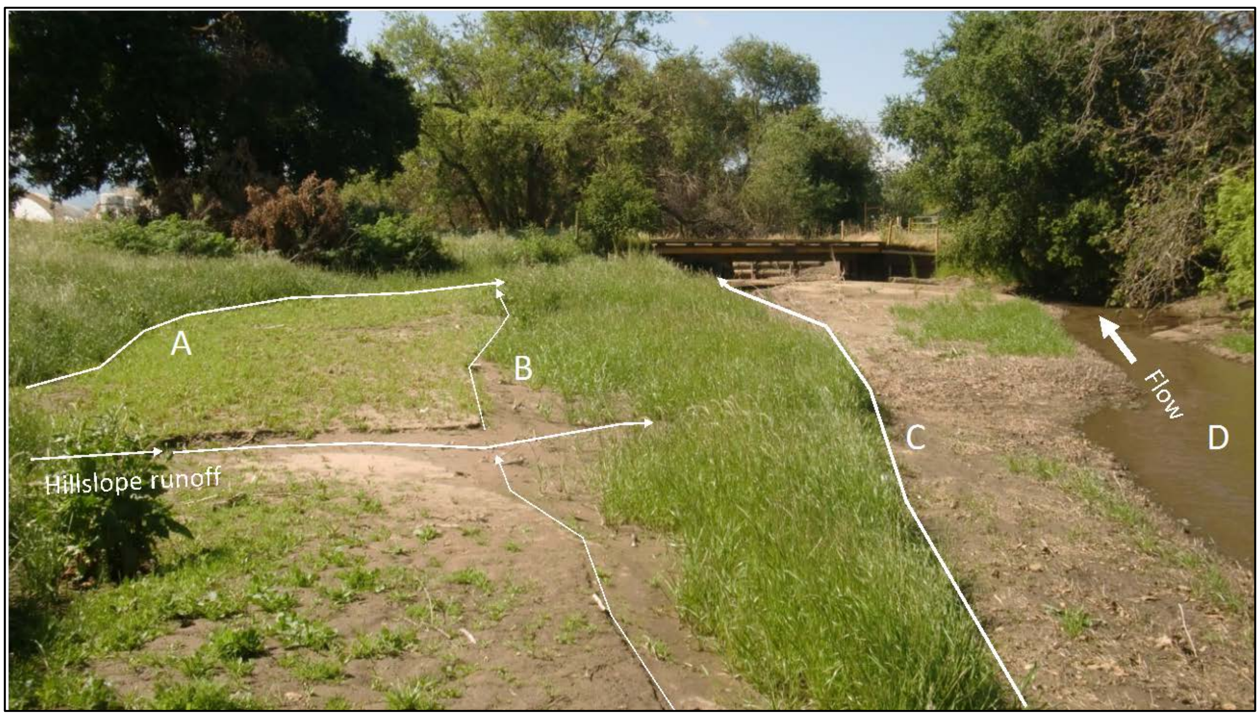

Figure 11 *Channel width allows flows to spread out and slow down. From left to right in this photo, there are four distinct areas (A-D) that yield evidence of a series of different flow events.*

Figure 12 provides another indication that flow depth in confined channel conditions was on the order of 4 feet deep.

Figure 12 Streamwood deposition against roughness elements in the channel, looking downstream. High flows were ~4 feet above channel bed.

An existing grade control structure is located at the downstream extent of the CASP project area (**Figure 13**) at Boronda Road. The grade control helps maintain the current slope in the CASP area; any changes to the structure will have to be designed in concert with the overall development.

Figure 13 Looking upstream on Gabilan Creek at grade control structure, south edge of CASP project at Boronda Road and Independence Boulevard.

Just downstream of Boronda Road, **Figure 14** and **Figure 15** show that fine sediments continue to braid within the channel where space permits. The channel is set within a trapezoidal floodway most likely designed to contain a 100-year flood event. The sloped banks are vegetated, and the channel is acting dynamically with its sediment supply.

Figure 14 Looking downstream at braiding sand bars and Danbury Street bridge, just downstream of Boronda Road.

Figure 15 Looking downstream from Danbury Street bridge. Fine-grained sediments naturally form braided systems.

Another grade control structure is located along Little River Drive as the creek flows toward Carr Lake (**Figure 16**). Grade control structures such as these are used in part to promote sediment deposition on the upstream side of the structures, potentially as a means to reduce sediment transport into Carr Lake and through the lower Reclamation Ditch system.

Figure 16 Concreted rip rap boulders control the channel gradient along Little River Drive.

This concludes the field reconnaissance narrative of Gabilan Creek; the field reconnaissance narrative for Natividad Creek is below.

2. Natividad Creek Corridor

Upstream of the CASP project area, along Natividad Creek at the creek crossing on Old Stage Road, evidence of high flow sediment deposition was found in the field adjacent to the channel (**Figure 17**). Under historical conditions (**Figure 2**) areas adjacent to the channel were naturally floodplains where sediment deposition over millennia is a primary reasons why agricultural lands are so productive in the Salinas Valley.

Figure 17 Evidence in adjacent agricultural field of overbank flows on Natividad Creek at Old Stage Road crossing.

Within the CASP project area, the Natividad Creek northwesterly mainstem (**Figure 18**) is channelized and does not support a riparian corridor as it traverses strawberry fields.

Figure 18 Looking north and upstream along Natividad Creek mainstem channel. Creek is highly channelized through much of the CASP project area.

A low rise in elevation (**Figure 19**) separates the mainstem from the northeastern tributary (**Figure 20**), which is also channelized and likewise no longer supports a riparian corridor as it traverses strawberry fields.

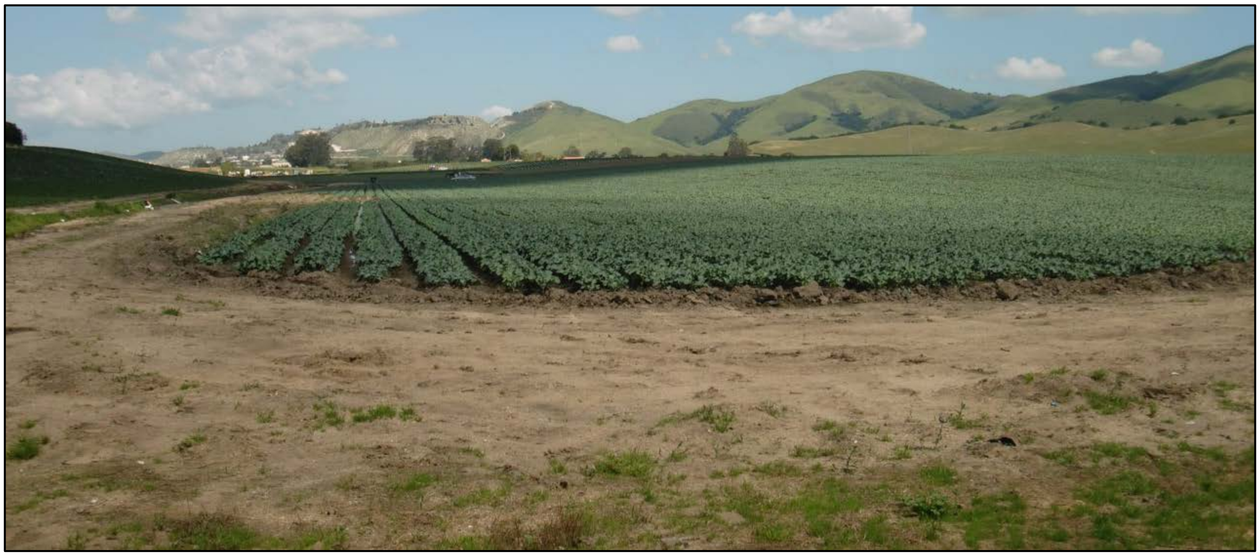

Figure 19 Looking northeast between Natividad Creek mainstem (left edge of image) and tributary channel (not visible to right). Strawberry fields predominate in the CASP project area.

Figure 20 Looking east and upstream along Natividad Creek tributary channel, which is highly channelized with no riparian corridor. Headwaters of the Natividad Creek are in the foothills; higher mountains in the distance drain westward to Gabilan Creek.

The confluence of the two channels (**Figure 21**) shows recent reworking in the area as a result of 2016-2017 wet winter flooding, and indicates that woody materials transported through the channelized stream sections from upstream areas such as from the riparian vegetation observed at Old Stage Road. Note also that there is a riparian corridor on the right bank that starts at this confluence and persists to the downstream end of the CASP project area at Boronda Road.

Figure 21 *Looking south and downstream at the confluence area of Natividad Creek mainstem and tributary channel. A riparian corridor is present along the right bank (when looking downstream) from this point to Boronda Road. Piled sediment and wood indicates agricultural reworking of flood-transported sediments, vegetation, and streamwood pieces.*

Natividad Creek experienced high flood flows that were similar to those on Gabilan Creek, as would be expected given the close proximities of the creeks and similar originations from the Gabilan Range. The riparian corridor on the right bank is situated directly adjacent to an existing hillslope, which naturally confined higher flows from spreading in that direction. Instead, flows spread out along the left bank floodway downstream of the confluence (**Figure 22**).

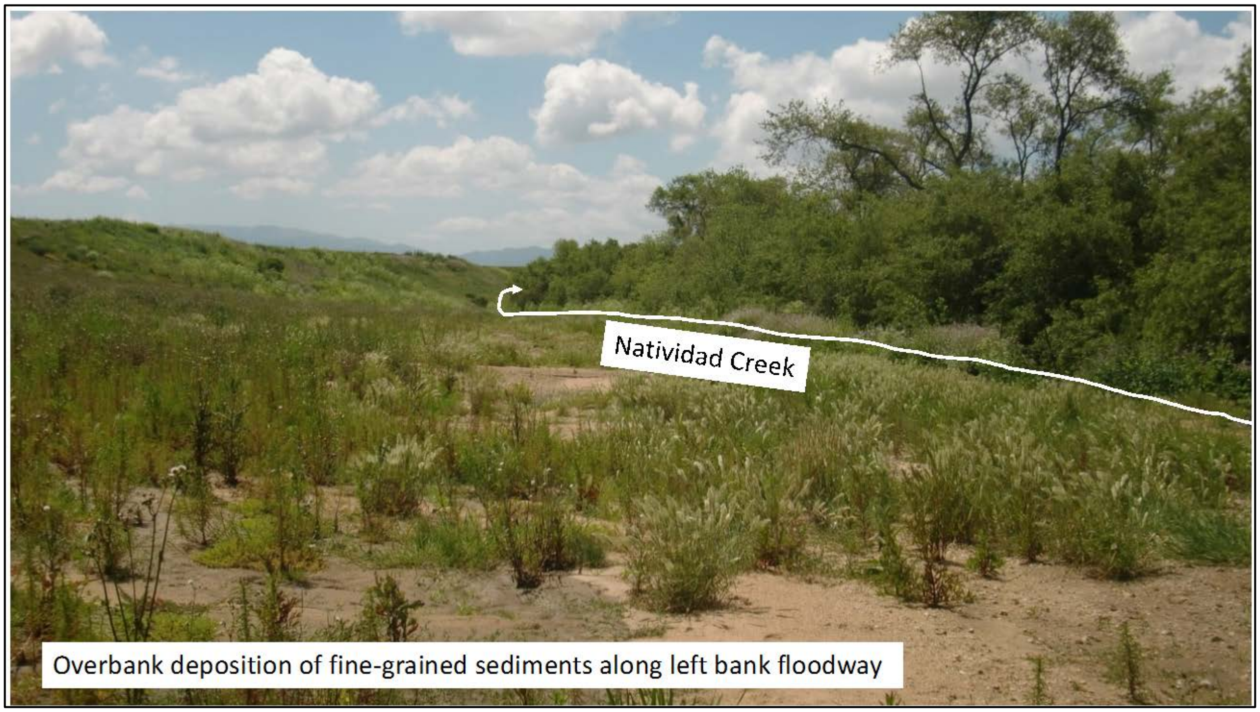

Figure 22 Looking south and downstream at a wide expanse of overbank sediment deposition from Natividad Creek flooding in wet winter 2016-2017. A riparian corridor and an adjacent hillslope are present along the right bank (when looking downstream) from this point

Field conditions indicated that in at least some locations along the floodplain, over one-foot of sandy materials were deposited. These sediments were predominately sands to silts, with some small gravels up to ¼ inch in diameter (**Figure 23**). On average, mostly sandy sediment sizes in Natividad Creek were larger compared to a smaller silty-sandy sediment size in Gabilan Creek.

Figure 23 Grain sizes ranging from silty to sandy deposited onto the left bank floodway on Natividad Creek in winter2016-2017 ranged from < 0.1 inch to about 0.25 inch.

The channel remained confined to the end of the CASP project area (**Figure 24**), but dynamic sediment behaviors were evident in narrow sand bars that had formed along the channel boundaries.

Figure 24 Looking upstream along Natividad Creek in the CASP project area, downstream of the confluence of the mainstem and tributary channel. Stream remains channelized with narrow sand bars forming along the channel edge and a riparian corridor on the right bank

Directly downstream of Boronda Road, the creek exits into what may be its remaining historically wide valley bottom in Natividad Creek Park (**Figure 25**). At this location, the creek immediately exhibits similar braiding behavior to that observed in Gabilan Creek.

Figure 25 Looking downstream along Natividad Creek just below Boronda Road. Stream opens into a valley bottom without confinement, allowing the creek to exhibit braiding behavior like that of Gabilan Creek.

Natividad Creek exits the valley bottom at Freedom Parkway (**Figure 26**) into an open culvert as it flows downstream toward Carr Lake.

Figure 26 Looking downstream under Freedom Parkway bridge along Natividad Creek. The stream exits the valley bottom into a culvert for passage under the roadway. The stepped culvert provides additional floodway space during high flow conditions.

At Garner Boulevard (**Figure 27**), evidence of high-water marks (**Figure 28**) along the right bank indicated ~4-5 feet of flow depth.

Figure 27 Looking downstream along Natividad Creek at Garner Boulevard.

Figure 28 Wood captured along a fence line adjacent to Natividad Creek at Garner Boulevard indicate a high-water mark of ~4 feet above the channel bed from winter 2016-2017 flows.

DRAFT
December 8, 2014

SB 610 Water Supply Assessment
For
Half of Central Specific Plan Area

Prepared by

Yarne & Associates, Inc.

For

California Water Service Company
254 Commission Street
Salinas, CA 93901

TABLE OF CONTENTS

Introduction and Background Information

In 2006, the City of Salinas initiated planning for the West, Central and East Specific Plan Areas (SPA): West, Central and East. Due to various factors, specific plans, EIRs and Water Supply Assessments (WSA) were not prepared or completed in the ensuing 8 years. In October 2014, developers requested Cal Water prepare a WSA for the half of the Central SPA that the California Public Utility Commission (CPUC) recognized as being served by Cal Water.

Senate Bill 610 (SB 610) (Chapter 643, Statutes of 2001 effective January 1, 2002) requires information on water supply be provided to local public agency decision-makers prior to approval of development projects that meet or exceed any of the following criteria:

1. A residential development of more than 500 dwelling units.
2. A shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet.
3. A commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.
4. A hotel or motel with more than 500 rooms.
5. An industrial, manufacturing or processing plant or industrial park planned to house more than 1,000 persons occupying more than 40 acres of land or having more than 650,000 square feet of floor area.
6. A mixed-used project that includes one or more of the projects specified above.
7. A project that would demand an amount of water equivalent to, or greater than the amount of water required by a 500 dwelling unit project.

Since Cal Water's half of the proposed Central SPA exceeds the first criteria, a SB 610 WSA is required.

This WSA addresses the adequacy of the water supply to meet estimated demands of the development project over the next 20 years in addition to those of Cal Water's existing customers and other anticipated future users under normal, single dry year and multiple dry year conditions. SB 610 requires that WSA information be included in the administrative record that serves as the basis for an approval action by the local public agency. Per Section 10910(c) (3) of the Water Code, the WSA is based on information contained in the 2010 Salinas District Urban Water Management Plan (UWMP) and from updated information developed by Cal Water. Alco Water Company is the water utility providing service to the other half of the Central SPA and is responsible for preparing a WSA for its service area.

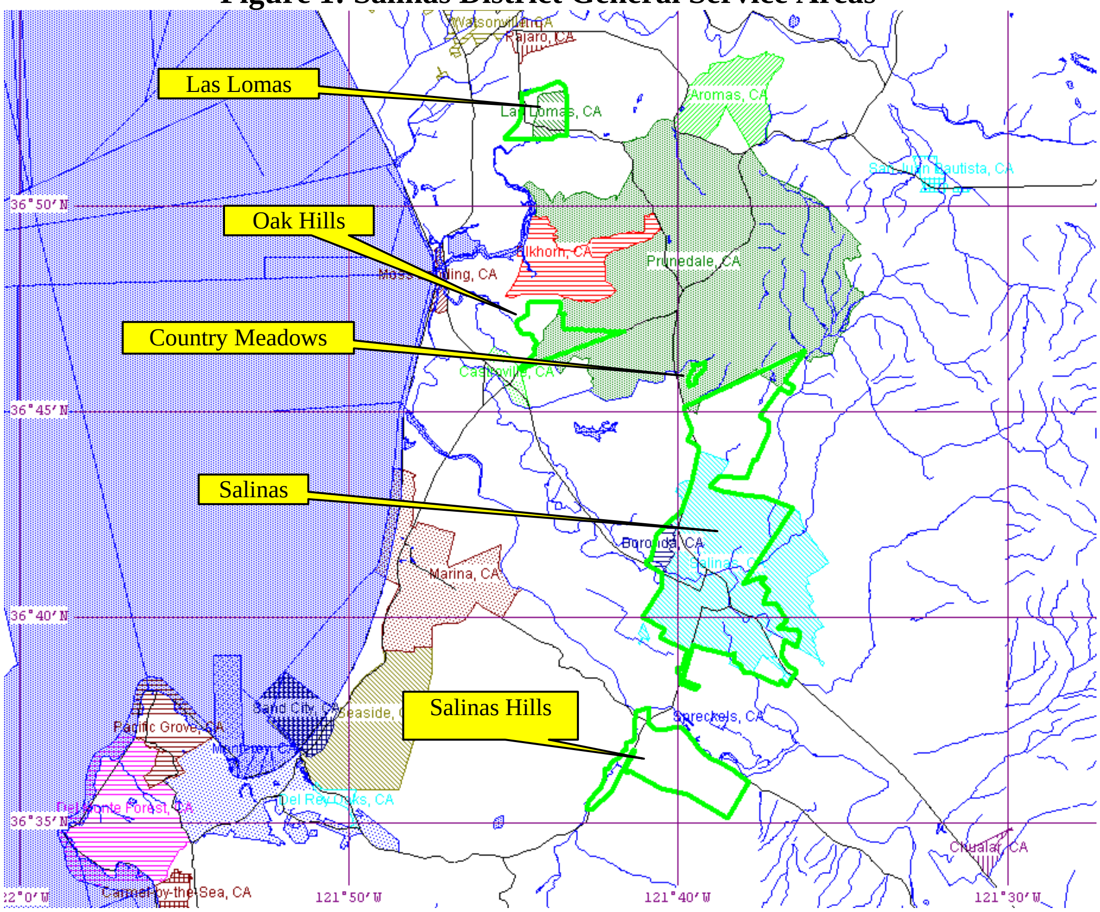
The location of the Central SPA is shown in Appendix A: Land Use Plan for Cal Water's ½ of Central Specific Plan Area (SPA) for City of Salinas taken from the City of Salinas General Plan – Future Growth Areas. The Central SPA, located in the northern part of the City of Salinas, is bounded on the west by Natividad Road, on the south by East Boranda Road, on the north by Russell Road and Old Stage Road and on the east by Constitution Blvd.

Cal Water Salinas District Service Areas

The Salinas District is comprised of several service areas shown in Figure 1.

The Salinas and Bolsa Knolls systems are linked hydraulically while the other smaller systems are separate. In the 2010 UWMP, data on demand and services was combined.

Figure 1: Salinas District General Service Areas

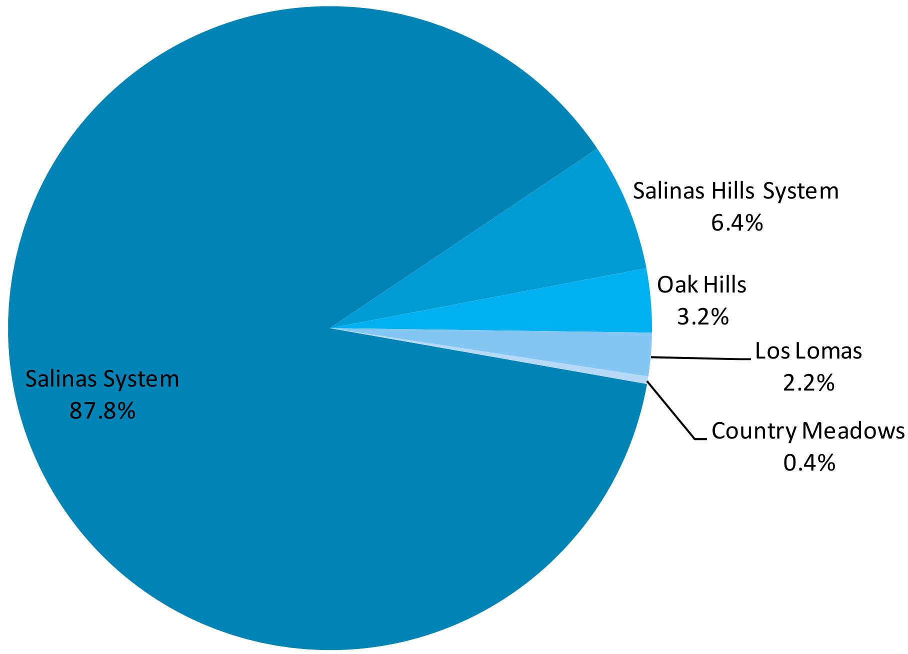


Cal Water's Salinas District encompasses most of the Salinas urban area, which is primarily a residential community supported by an agricultural economy. The major transportation route in the area is State Highway 101. The Southern Pacific Railroad also serves the area.

The Salinas District serves residents and businesses of the City of Salinas and those of the unincorporated communities of Bolsa Knolls, Las Lomas, Oak Hills, Country Meadows, Salinas Hills, Buena Vista and Indian Springs. A single distribution system provides service to the City of Salinas and Bolsa Knolls. Smaller hydraulically isolated distribution systems provide service to the other communities.

Figure 2 shows the percentage of customer services in the areas served. The City of Salinas has 81% of all customers within the Salinas District.

Figure 2: Salinas District Distribution of Customer Services in Areas Served (2010)



Water Demand Projection: ½ of Central Specific Plan Area

Cal Water will serve the western portion of ½ of the Central SPA and is demarcated by the PG&E electric transmission line that bisects the plan area in a north-south direction. Cal Water's area consists primarily of residential land uses: 198.54 acres of 1,274 dwelling units. It includes 19.61 acres for two public schools and a fire station, and 16.55 acres of irrigated parks. Non water using areas include: 33.31 acres of open space and 4.78 acres for utility functions (Cal Water and PG&E).

The water demand projection is based on the data shown in Table 1 and assumptions that water conservation measures will comply with existing codes and regulations.

Table 1
Cal Water's ½ Central Specific Plan Area: Land Use Summary for Potable Water Use

Category	Dwelling Units	Acres
Residential		
Sentrini		
(APN 211-03-008 & 211-013-003)	272	37.25
Noon		
(APN 153-091-003)	23	3.92
Christensen		
(APN 153-91-001 & 005)	663	75.15
Probert and Condiroli Trusts		
(APN 153-91-005)	238	70.81
Gladstone Farms		
(APN 211-013-004)	78	11.41
TOTAL	1,274	198.54
Public Facilities		
Parks:		16.55
Schools/Fire Station:		19.61
Grand Total:		234.70

Using City of Salinas Planning Department guidelines of 3.67 persons per residential dwelling unit, the estimated population of Cal Water's ½ of Central SPA is 4,676 persons.

Residential Demand:

Cal Water data for Salinas District single family residential water use for the period from 2005 to 2010 averaged 125,396 gallons per service per year. Conservatively assuming that all 1,274 projected dwelling units use this amount of water yields 159,754,500 gallons per year or 490.37 AFY. This is equivalent to an average daily per capita consumption 93.6 gallons/day.

Public Facilities:

Schools/Fire Station: Planning Design Consultants estimates the water use factor for schools is 3,500 gallons/day/acre (Rancho San Juan Specific Plan, 2003). This factor is used here for the schools and the fire station proposed in Cal Water's ½ Central SPA.

Estimated annual average daily public facilities water demand: 19.61 acres x 3,500 gallons/day/acre = 68,635 gallons/day or 77.0 AFY

Parks:

Planning Design Consultants estimates the water use factor for active parks is 2,000 gallons/day/acre. This factor is used here for the active parks proposed in Cal Water's ½ Central SPA. Open space areas will not be irrigated with potable water supplied by Cal Water.

Estimated annual average daily active park water demand: 16.55 acres x 2,000 gallons/day/acre = 33,000 gallons/day or 37.1 AFY

Total Estimated Average Daily Water Demand for Cal Water's ½ Central SPA: 604.3 AFY or 539,036 gallons/day

California Water Code 10631, Paragraph (e) (2), requires a water use projection (average annual demand forecast) in five-year increments for a 20 year period. It is assumed that the time required for approval of the Central SPA and certification of the EIR is one year (2015) and that preparation of developer subdivision plans and tentative maps will occur concurrently. It is assumed that City approval of the latter will require a half a year and will occur in October - November 2015 and that construction of plan area infrastructure and residential dwelling units will start in the first quarter 2016. If it takes approximately 20 months for infrastructure to be completed and the first phase of homes to be built, sold and initial occupancy to start, then water demands will start in 2018. If it takes 17 years for all proposed facilities to be completely built and fully occupied the projected water demand in 2035 will be 604.3 AFY.

Assuming development occurs linearly, the water demand forecast for Cal Water's ½ Central SPA in five-year increments is as follows:

Year	**Cal Water's ½ Central SPA Average Annual Water Demand (AFY)**
2015	0
2020	71.2
2025	249
2030	427
2035	604.3

Salinas District Water Demand

Cal Water designates customer classifications as follows:

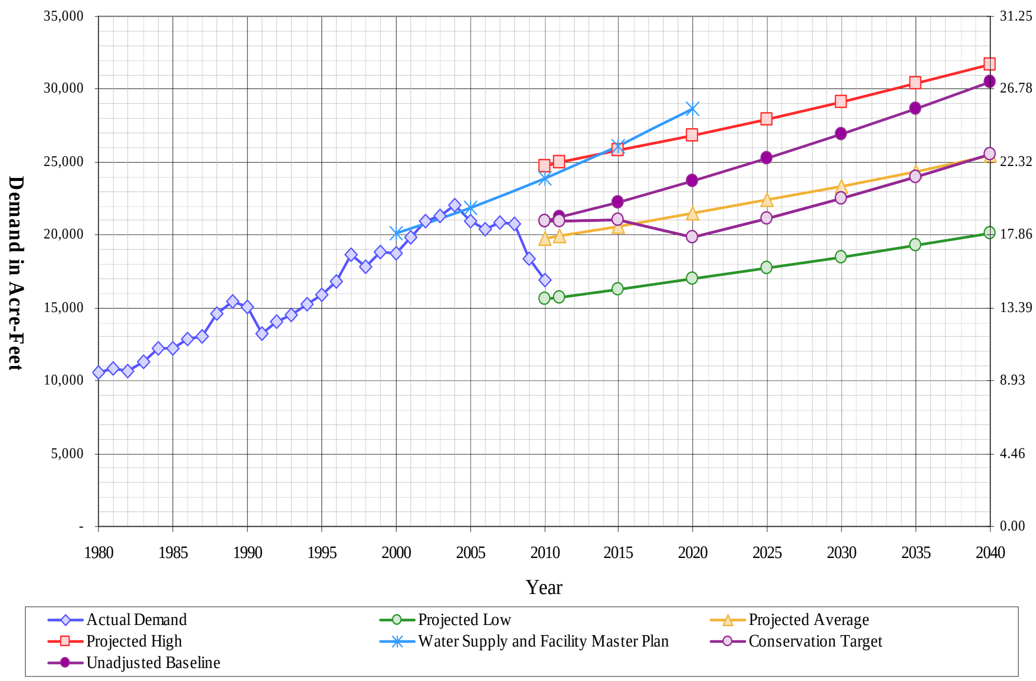
- Single Family Residential
- Multifamily Residential
- Commercial
- Industrial
- Government
- Other

Cal Water historically made water demand projections by calculating growth rates for each customer classification. These growth rates were based on five or ten year averages of service count data and were extended over the planning horizon resulting in projected service counts. Three sets of demand per service values were calculated: low, average, and high. These were applied to the projected service counts to calculate projected water demands for each customer classification. As a result of Senate Bill 7 (SBx7-7) this method is no longer used for projecting total water demand, but it is used as for calculating projected services, population, and distribution of demand by customer classification.

SBx7-7 requires two demand projections be made: 1) an unadjusted baseline demand, and 2) a target demand. The unadjusted baseline water demand projection is the total demand expected without reduction in water use due to an expanded water conservation program. It is equal to forecasted population multiplied by the 2005-09 average, or 139 gpcd.

The target water demand projection assumes achievement of water conservations savings and is calculated by multiplying SBx7-7 target gpcd values and projected population. These conservation savings are illustrated in the comparison of projected demands shown in Figure 3.

Figure 3: Salinas District Actual and Projected Demand



Cal Water has expanded its water conservation programs and developed new ones for the Salinas District as a result of increasing in response to state law and policies requiring further reductions in per capita daily water use. SBx7-7 mandates a 20 percent reduction in per capita urban water use by 2020. The CPUC requires implementation of conservation programs and rate structures to achieve reductions in per capita water use. The *Memorandum of Understanding Regarding Urban Water Conservation in California* (MOU), of which Cal Water has been a signatory since 1991, requires implementation of conservation programs. The Salinas District Water Conservation Master Plan, which addresses these requirements, is included as Appendix G in the 2010 UWMP.

The 2015 and 2020 district-specific targets for Salinas District are 131 and 117 gpcd, respectively. Over the last five years District demand has averaged about 139 gpcd. Thus, per capita demand needs to decrease by 7 percent by 2015 and by 18 percent by 2020 in order to meet these targets.

The target water demand projection includes conservations savings from passive and active demand management, which are described in Section 6 of the UWMP.

Actual and projected water use through 2040 is shown in Table 2. The quantities are the total target demand projection based on SBx7-7 gpcd targets, including unaccounted for water.

Table 2: Salinas District Water Demand – Actual and Projected AFY								
	2005 Actual	2010 Actual	2015	2020	2025	2030	2035	2040
Total	20,933	16,940	20,053	19,840	21,125	22,504	23,984	25,572

Salinas District Demand plus ½ Central SPA Demand

Table 3 combines the projected demands for the Salinas District and ½ of the Central SPA. In 2020, the increase in District demand due to ½ of the Central SPA is only 0.35% and in 2035 or in 20 years from 2015, the increase is 2.5%.

Table 3: Salinas District Water Demand + ½ Central SPA Demand AFY								
	2005 Actual	2010 Actual	2015	2020	2025	2030	2035	2040
District	20,933	16,940	20,053	19,840	21,125	22,504	23,984	25,572
½ Central			0	71	249	427	605	605
Total			20,053	19,911	21,374	22,931	24,589	26,177

Although the water demands of ½ Central SPA constitute a very small percentage of total projected Salinas District demand, the combined demand projection is used here.

Salinas District Water Supply

The Salinas District water supply comes from pumped groundwater within District boundaries. It is extracted from aquifer segments of the Salinas Valley groundwater basin known as the Pressure Area and Eastside Area. The Salinas Valley groundwater basin, which is overdrafted, is unadjudicated. The California Water Resources Control Board has initiated adjudication proceedings in the event that Monterrey County Water Resources Agency (MCWRA) is not able to effectively reduce the overdraft.

The Pressure Area is a region of gradually declining groundwater elevations and is characterized by three confined aquifer systems, overlain and separated by thick clay layers that act as aquicludes. These aquifers named for their relative depths are known as the “180 Foot", the “400 Foot”, and “900 Foot” aquifers. Cal Water pumps from all three aquifers.

The groundwater level in the Eastside Area is declining more rapidly than any other area in the Salinas Valley groundwater basin. The Eastside Area is comprised of unconfined randomly scattered water bearing strata.

Since the surface elevation in the Salinas District ranges from 40 to 70 feet above sea level, the three aquifers of the Pressure Area are all below sea level. There is hydrologic continuity with the ocean and the three aquifers.

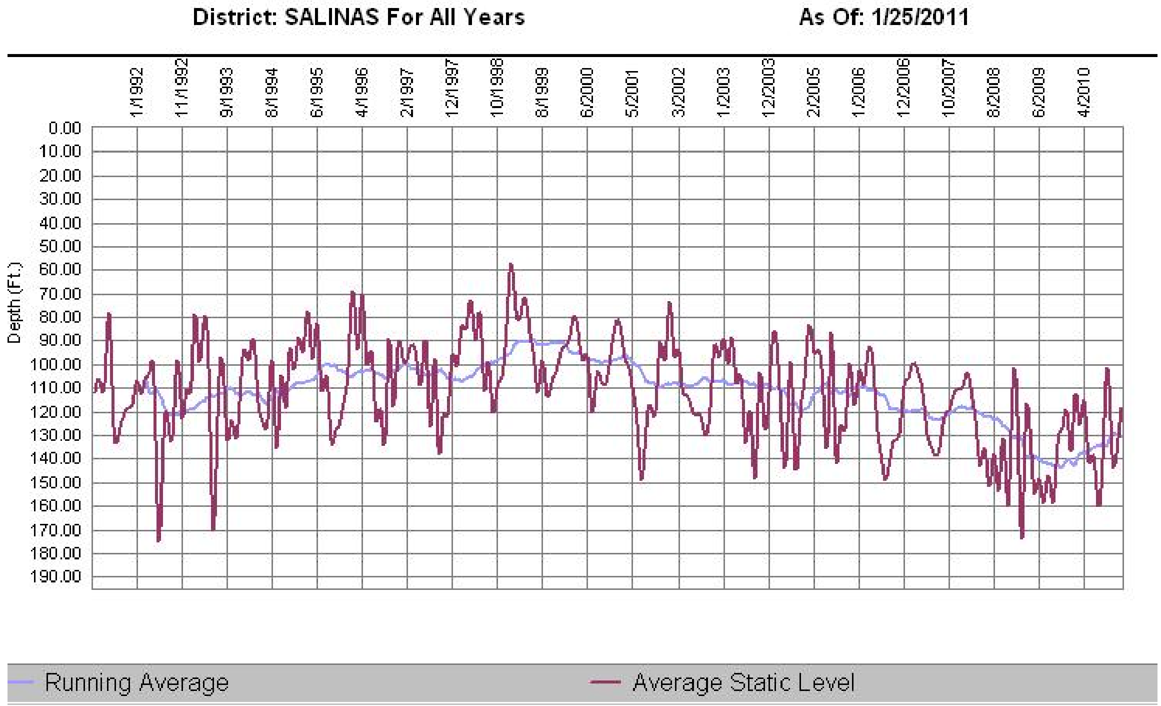
MCWRA has estimated that the annual non-drought overdraft of the Salinas Basin is about 45,300 AF per year. Because of the hydrologic continuity between the ocean and the aquifers of the Pressure Area, seawater has been intruding into these aquifers at an estimated rate of 28,800 AF per year.

Groundwater pumping throughout the Salinas Valley has contributed to the overdraft of the groundwater basin. MCWRA numbers indicate that water levels have declined in all four of the basin’s areas. However, the minor declines in the Upper Valley and Forebay areas appear to be in response to drought conditions. Recharge in these areas from releases from the San Antonio and Nacimiento Reservoirs have historically stabilized groundwater levels in these two areas. Declines since 1987 are believed to be the result of reduced recharge supplies.

Seawater has advanced into the 180 Foot aquifer to within one mile of Cal Water’s closest well. When possible, Cal Water shifts groundwater pumping from the 180 Foot and Eastside aquifers to wells further south and in the 400 Foot aquifer of the Pressure Area.

Except for annual deviation of approximately thirty-five feet, the average static groundwater levels in District wells since 1961 has changed elevation only during drought years. In 1976 and 1977, the running average level declined by twenty feet. Recovery occurred in 1982 and 1983 when storm runoff refilled local reservoirs allowing groundwater recharge activities to resume. With extended drought conditions commencing in 1984, the running average elevation again began declining and by the summer of 1992 had dropped by thirty-five feet. Well level averages from 1990 through 2010 are shown in Figure 4.

Figure 4: Salinas District Average Well Levels



The Salinas District has a total of 59 wells, including one leased well. Forty two (42) of these wells are active and operational and one is in Standby status. The design capacity of the active operational wells is 30,990 gpm, a rate that could produce 44.6 mgd or 50,000 AFY of water. The five-year average day demand is 18.4 mgd or 20,628 AFY (41% of design capacity). The historic high for these parameters occurred in 2004 for average day at 19.4 mgd and in 2005 for maximum day at 31.8 mgd or 22,080 gpm = 71.2% of design capacity.

Data Table 4 from the 2010 UWMP show the actual quantity of the groundwater pumped in the Salinas District for a 5 year period.

Table 4: Salinas District Groundwater Pumped – AFY				
2006	**2007**	**2008**	**2009**	**2010**
20,431	20,865	20,778	18,414	16,940

The amount of groundwater projected to be pumped is shown in the Table 5. The projected demand for 2040 is 26,375 AFY or 52.7% of design capacity.

Table 5: Amount of Groundwater Projected to be Pumped – AFY (Table 19)						
Source	**2015**	**2020**	**2025**	**2030**	**2035**	**2040**
Salinas Valley GW Basin	20,523	20,065	21,538	23,105	24,775	26,375

Cal Water's ½ of Central SPA Water Supply

A new well in Cal Water's ½ of the Central SPA and other wells near that area are expected to provide an adequate reliable supply of water to meet forecasted demand. Cal Water plans on constructing one new well within its area. A site has been designated for this new well on the land use map. A well with a design capacity of 1,000 gpm operated at a 90% utilization rate would produce 1,453 AFY or 2.4 times average annual demand. Maximum day demand in the Salinas District is 1.6 times average day demand which would be 600 gpm for Cal Water's ½ of the Central SPA.

Cal Water has two wells close to its ½ of the Central SPA. With its distribution and storage system Cal Water is able to move water from pressure zones with excess supply to zones that are short of supply for supply reliability.

Water from wells near the Central SPA complies with all federal and state drinking water standards. So it is expected that the new well within the Central SPA will also meet drinking water quality standards.

Groundwater Basin Boundaries and Hydrology

The following description is from DWR's Groundwater Bulletin 118, which is in Appendix D of the 2010 UWMP. The DWR bulletin provides additional details on the basin.

The District covers areas in both the 180/400 Foot Aquifer Subbasin (3-4.01) and the Eastside Aquifer Subbasin (3-4.02). The 180/400 Foot Aquifer Subbasin includes the lower reaches and mouth of the Salinas River. The Southwestern basin boundary is the contact of Quaternary Alluvium or Terrace Deposits with the granitic basement of the Sierra de Salinas. Further north along the western Salinas Valley margin the basin boundary is the contact with the Quaternary Paso Robles Formation, or Aromas Red Sands of the Corral de Tierra Area Subbasin. The extreme northwest boundary of the sub basin is shared with the Salinas Valley-Seaside Area Subbasin along the seaward projection of the King City Fault. The Subbasin is bounded by the Monterey Bay to the northwest. The northern sub basin boundary is shared with the Pajaro Valley Groundwater Basin and coincides with the inland projection of a 400-foot deep, buried clay-filled paleodrainage of the Salinas River. This acts as a barrier to groundwater flow between these sub basins. The northeastern boundary is shared throughout most of its length by the adjacent Salinas Valley-Eastside Subbasin, and to the north with a shorter length of the Langley area Subbasin. The northeastern boundary generally coincides with the northeastern limit of confining conditions in the 180/400-Foot Aquifer Subbasin and the location of State Highway 101. The southeastern boundary is shared with the Lower Forebay sub basin and is the approximate limit of confining conditions in an up-valley direction. The 180/400-Foot Aquifer Subbasin boundaries generally coincide with those of the Pressure Area of the Monterey County Water resources Agency (MCWRA).

The Eastside Aquifer sub basin extends from approximately five miles north of the city of Salinas to twenty five miles south of the town of Gonzales along the eastern side of the lower Salinas Valley. The sub basin is bounded to the north by the Pleistocene Aromas Red Sands of the Salinas Valley-Langley Area Subbasin. To the south, the sub basin shares a boundary with the Quaternary Alluvium deposits of the Salinas Valley-Lower Forebay Aquifer Subbasin. The western sub basin boundary generally coincides with the northeastern limit of confining conditions in the adjacent 180/400-Foot Aquifer Subbasin and with Sate Highway 101. The eastern boundary is the contact of the Quaternary Terrace deposits with granitic rocks of the Gabilan Range. The sub basin boundaries are generally correlative with those of the East Side sub area of the MCWRA. Intermittent streams such as the Natividad, Alisal, Quail, Parsons, Muddy and Johnson Creeks drain the western slopes of the Gabilan Range and flow across the Subbasin toward the Salinas River on the west side of the Valley.

MCWRA Groundwater Management Plan

MCWRA's plan is comprised of groundwater management programs and a suite of projects such as the Salinas Valley Water Project (SVWP) which have and continue to help reduce seawater intrusion rates. Importantly, water conservation programs are being implemented by Cal Water and by agricultural irrigators,

The MCWRA Groundwater Management Plan is included as Appendix H in the 2010 UWMP. MCWRA requires annual extraction reports from all agricultural and municipal well operators. It has developed programs and projects to reduce seawater intrusion and nitrate contamination in order to provide an adequate supply of good quality water to meet all current and projected future demands in the Salinas Valley groundwater basin.

The Salinas District has not experienced a supply shortfall during extended drought events. Cal Water believes that despite an overdraft condition in the groundwater basin, its total projected demands will be met by its existing groundwater supply even in multiple dry years. This is based on data showing that during previous dry year periods, its supply has always met demands, and that its well water levels have recovered in ensuing years of normal and above average rainfall. Because MCWRA's groundwater management programs and projects have helped to reduce overdraft and increase the reliability of the groundwater supply, Cal Water expects to be able to meet 100 percent of its dry year demands through 2040 with groundwater.

Cal Water plans on increasing well capacities over time as older wells are taken out of service and replaced with newer high capacity wells. Total design capacity is also expected to increase as treatment systems are constructed for wells with water quality problems.

In its *Feasibility Study for a Long Term Water Supply Plan for the Salinas District,* (July 2009) Cal Water evaluated other water supply source options than groundwater which includes drilling new wells, rehabilitating older wells and adding treatment facilities at well stations if water quality issues make this necessary. The plan includes enhanced water conservation. Desalinating ocean water and diverting Salinas River water were evaluated and judged non feasible due to regulatory, environmental, legal and cost issues. Groundwater will continue to be the only source of supply until the benefits of these other sources outweigh their disadvantages.

Water quality issues of concern in the Salinas District are nitrates and volatile organic compounds (VOCs). Nitrates are present in most wells at varying concentrations. Its presence is attributed to vertical movement from the ground surface through geologic materials and unsealed or improperly abandoned wells in response to pumping in deeper strata. In the eastside area, the lack of effective confining zones can induce cross-flow from shallower aquifers and result in deterioration of water quality if there are surface sources of contaminants present. Water quality parameters are continuously monitored for compliance with drinking water standards. If nitrates or VOC concentrations exceed drinking water quality standards, Cal Water will either provide treatment facilities or replace wells where location, age, condition and yield make treatment infeasible.

Salinas District Short Term (5 to 10 Years) Supply Plan

Cal Water will continue to develop wells within its Salinas District service area to meet growth in demand and to replace older wells that are at the end of their useful life or which have water quality problems for which treatment is not economically justified. For new wells, candidate sites are assessed in terms of favorable hydro-geologic conditions, distribution system requirements, and compliance with regulatory criteria. Sites that meet these criteria have a test hole drilled to verify the presence and nature of aquifer materials and water samples are withdrawn to test water quality. If geologic and water quality analyses indicate the site is suitable for a drinking water production well, the site is purchased and developed. Depending on land acquisition, permitting and approval issues and including design, construction and start up, it can take two to three years for Cal Water to bring a new well on line.

Salinas District Longer Term (10 to 30 Years) Supply Plan

For longer term supply, Cal Water will continue to evaluate how best to increase supply through development of source(s) within and possibly outside its service area boundaries. Cal Water coordinates closely with MCWRA in developing and evaluating alternative supply options outside its district boundaries.

The following is a summary of alternatives that are being further considered:

1. <u>Out of District Service Area Boundary Wells.</u>
   This involves identifying a suitable location for a well field and determining whether Cal Water could develop this site and convey pumped water to the Salinas District to supply areas where water is needed. Existing information indicates that there are areas outside Salinas that have good water quality and reliable yields and therefore might be candidates

for developing future supplies. This alternative is consistent with approaches being considered by MCWRA. A key issue with this alternative is to ensure that agricultural users of groundwater would not be adversely impacted by the development and use of such a well field. A pilot project may be needed to demonstrate that pumping and conveyance of water to Salinas would not significantly impact existing groundwater levels and yields of agricultural wells.

2. Phase 2 MCWRA Diversion Project. Phase 1 involves blending diverted surface water with reclaimed water from the Monterey Water Pollution Control Agency treatment plant. This blend of waters is used in lieu of pumping groundwater for irrigation of 12,000 acres of agricultural land near the coast. The intent of the Phase 1 SVWP project is to stop the landward advance of seawater intrusion in the SVGWB by reducing agricultural groundwater pumping. Phase 2 of the SVWP is to increase the amount of diverted surface water in order to address urban groundwater needs. In Phase 2, additional diverted Salinas River water would be provided to agricultural irrigators who would further reduce their groundwater pumping and thus make that supply available for municipal use. Cal Water is coordinating with MCWRA on Phase 2 SVWP in order determine how much water could be expected to meet Salinas District long-term supply needs. As currently envisioned, the SVWP diversion facility will be at Moro Cojo, and the Phase 2 urban component is estimated to be up to 10,000 AFY. However, fisheries requirements may reduce this amount to 5,000 AFY. Since the urban component will be allocated among a number urban users, it is likely that Cal Water would get no more than 50% or between 5,000 and 2,500 AFY.

3. Non-potable Demands Supplied by Non-Potable Wells.
   This alternative requires substantial non-potable uses such as golf courses, parks and green spaces, car washes, dust control, industrial cooling water, certain types of industrial process waters (wash water) capable of being economically served by wells where water quality is not acceptable for drinking water (e.g., high nitrates) but would be compatible for non-potable use. While this alternative does not reduce overall pumping from within the District's boundaries, it would permit use of well facilities that have been abandoned due to water quality problems and free up more capacity of high quality potable wells to meet drinking water demands.

Salinas District Recycled Water

The Monterey Regional Water Pollution Control Agency (MRWPCA) provides residential wastewater treatment for the Salinas urban area and after advanced treatment recycles 100% of the treated effluent for agricultural irrigation during the summer months. Of the nearly 30 mgd of flow recycled by MRWPCA, 10 mgd or 33% comes from the City of Salinas, 70% of which is water supplied from wells within Cal Water service area.

The Central SPA provides for wastewaters generated within the plan area to be collected, conveyed and treated at the City's existing treatment plant. Effluent from that plant is currently used for irrigation of agricultural lands, which results in a reduction of groundwater pumping by the irrigators, which in turn provides more groundwater supply for Cal Water to meet its Salinas District demands. So, wastewaters generated within Cal Water's ½ Central SPA will be reclaimed and will have the effect of increasing available urban groundwater supply if irrigators proportionately reduce their groundwater pumping.

The estimated volume of wastewater generated in the Salinas District to 2040 is shown in Table 6. According to MRWPCA, 60 percent of all effluent it receives is recycled and used for agricultural irrigation outside Cal Water's service area. Use of this "surface" is intended to reduce groundwater pumping for agricultural irrigation.

Table 6: Salinas District Recycled Water - AFY							
Category	**2010**	**2015**	**2020**	**2025**	**2030**	**2035**	**2040**
Wastewater Collected and Treated	10,282	10,749	11,237	11,749	12,284	12,845	13,433
Recycled Water – Agricultural Irrigation	6,169	6,449	6,742	7,049	7,371	7,707	8,060

Using this assumption, the quantity of groundwater pumped by Cal Water for the Salinas District can be reduced by the quantity of recycled water used for crop irrigation. In 2040, the net demand of pumped groundwater in the Salinas District would be 26,375 AFY – 8,060 AFY = 18,315 AFY.

Water Conservation

Cal Water has been practicing water conservation programs in the Salinas District for over 15 years. To achieve its SBx7-7 per capita water use targets for 2015 and 2020, it has intensified its water conservation program. Cal Water programs include educational, informational, and customer assistance activities, distribution system water audits and leak detection, promotion of water efficient landscape guides, residential surveys, public and school education. Cal Water promotes installation of water conserving fixtures such as toilets, showers, washing machines, and low water use landscaping. Table 7 shows additional projected water conservation savings by specific programs through 2015. These programs will be sustained in order to achieve further per capita water use reductions.

Table 7: Salinas District: Projected Water Conservation Savings by Program

Program	Annual Water Savings (AF)				
	2011	**2012**	**2013**	**2014**	**2015**
CORE PROGRAMS					
Rebates/Vouchers					
Toilets	22.6	44.3	65.1	102.7	138.8
Clothes Washers	7.0	10.3	13.5	25.1	36.2
Urinals	0.0	0.0	0.0	0.0	0.0
Customer Surveys/Audits	15.4	33.5	49.8	87.2	120.8

Pop-Up Nozzle Distribution	39.0	78.0	117.0	163.7	210.5
Subtotal Core Programs	***96.7***	***190.1***	***279.3***	***424.0***	***561.5***
NON-CORE PROGRAMS					
Direct Install Toilets/Urinals	24.9	48.9	71.8	156.4	237.5
Smart Irr. Controller Vendor Incentives	0.1	0.1	0.2	15.6	31.1
Large Landscape Water Use Reports	6.2	6.2	6.2	13.5	13.5
Large Landscape Surveys/Incentives	9.6	19.3	28.9	40.5	52.0
Commercial Kitchen Rebates/Vouchers	0.0	0.0	0.0	4.8	9.6
Cooling Tower/Process Water Retrofit Incentives	0.0	0.0	0.0	0.0	0.0
Subtotal Non-Core Programs	***40.8***	***74.5***	***107.2***	***230.8***	***343.8***
Total Core & Non-Core Program Savings	**137.6**	**264.6**	**386.5**	**654.7**	**905.3**

Cal Water followed a detailed, multi-step process to identify the best mix of programs to achieve required savings. After a qualitative analysis of various program measures, those most appropriate for the Salinas District were quantitatively analyzed. From that analysis the above programs were selected. In addition to Cal Water's experiences, information developed by the California Urban Water Conservation Council and the Alliance for Water Efficiency was utilized to estimate water savings.

In the unlikely event of a protracted or unexpected water shortage, Cal Water has developed a four-stage rationing plan, which includes both voluntary and mandatory water use restrictions. Table 8 is a summary of this program.

Table 8: Cal Water Demand Reduction Methods			
Shortage	Stage	Demand Reduction Goal	Type Of Program
Minimum 5 - 10%	Stage 1	10% reduction	Voluntary
Moderate 10 - 20%	Stage 2	20% reduction	Voluntary or Mandatory*
Severe 20 - 35%	Stage 3	35% reduction	Mandatory*
Critical 35 - 50%	Stage 4	50% reduction	Mandatory*

* Mandatory = Allocations

The following lists the actions to be taken during periods when a reduction in consumption is required:

Stage 1

- California Water Service Company maintains an ongoing public information campaign consisting of distribution of literature, speaking engagements, monthly bill inserts, and conservation messages printed in local newspapers.
- Educational programs in area schools are also ongoing.

Stage 2

- California Water Service Company will aggressively continue its public information and education programs.
- Ask consumers for 10 to 20 percent voluntary or mandatory water use reductions.
- Prior to implementation of mandatory reductions, obtain approval from CPUC.
- Lobby for passage of drought ordinances by appropriate governmental agencies.

Stage 3

- Implement mandatory reductions after receiving approval from CPUC.
- Maintain rigorous public information campaign explaining water shortage conditions.
- Water use restrictions go into effect; prohibited uses can include watering resulting in gutter flooding, using a hose without shutoff device, filling of pools or fountains, etc.
- Limiting landscape irrigation by restricting the hours of the day and or days of the week during which water for irrigation can be used.
- Monitor production weekly for compliance with necessary reductions.
- Installation of a flow restrictor on the service line of customers who consistently violate water use restrictions.

Stage 4

- All of steps taken in prior stages intensified.
- Discontinuance of water service for customers consistently violating water use restrictions.
- Monitor production daily for compliance with necessary reductions.
- More restrictive conditions for, or a prohibition, of landscape irrigation

Implementation of Supply Plans and Conservation Programs

The Cal Water Salinas District is supported by its engineering, water quality and customer service staff in San Jose, which is responsible for planning, designing, construction, operating, maintaining and managing all Salinas District water system facilities and programs

Cal Water schedules preparation of plans, designs and construction of new wells and related distribution and storage facilities so as to increase supply capacity ahead of projected demand growth thereby providing excess supply capacity to accommodate more rapid growth than anticipated and dry weather periods that might result in temporary declines in the groundwater table level and possibly well yields. Typically, the goal for the supply capacity of the wells is to accommodate the maximum day demand (1.6 times the average day) with the largest source (greatest capacity well) being down or not operating.

Other Supply Factors

Water Rights

Under state law, "the use of percolating groundwater in California is governed by the doctrine of correlative rights and reasonable use, which gives the overlying property owner a common right to reasonable, beneficial use of the basin supply on the overlying land." The exercise of Cal Water rights to percolating groundwater occurs after Cal Water acquires ownership of a property to be used as a production well site.

Water Supply Permits and Approvals

For prospective new well sites and other water facilities such as storage tanks and booster pump stations, Cal Water follows a standard procedure in which it establishes interest on the part of a property owner to sell all or a designated piece of his/her property to Cal Water for a water supply purpose. In the case of a well site, Cal Water first determines its suitability for a production well. This includes a conducting a sanitary survey, Phase 1 environmental assessment, a right of entry agreement, design and construction of a test well, testing of the yield and water quality of the test well and evaluation of findings. If a site is determined to be suitable, Cal Water generally purchases the property from the owner. In the case of public properties, it may enter into a long-term lease or obtain a permanent easement.

Cal Water is required to obtain the following permits including:

1. Water system amendment permit from California Department of Health Services (DHS)
2. A conditional use permit from the City of Salinas
3. Well construction/building permit from the City of Salinas
4. Well drilling permit from Monterey County Health Department
5. An air quality permit from the Air Quality Management District

After the well is constructed and before use, Cal Water is required to demonstrate to DHS that water from the well complies with all drinking water standards. Cal Water also is required to file the well logs obtained by the driller with the Department of Water Resources**.**

Design and Construction of Water Supply System

A complete water system includes wells and pumps, transmission lines, storage facilities and booster pumps, distribution system, meters, etc. As planning and design proceed further on its ½ of the Central SPA, Cal Water will work closely with the City of Salinas and it's planning consultant, developers and their engineers, the CA Dept of Drinking Water, the MCWRA and others involved with the planning, design, construction and operation of the proposed water system.

Cal Water will prepare all proposed design drawings and specifications for water systems for compliance with state and Cal Water standards with respect to supply and storage capacities, pipe sizes, booster pumps, fire flows, equipment, materials, communication and control systems and integration with the Salinas District system.

Capital costs for design and construction of the water distribution system, storage and booster pump stations are the responsibility of the developers of the Central Area Specific Plan. Capital costs for new well stations will be recovered by Cal Water through a per lot assessment fee to developers in accordance with CPUC rules.

With respect to the Salinas District, Cal Water has an ongoing capital improvement program to upgrade and improve the distribution system, replace wells that have reached the end of their useful life, provide treatment of groundwater due to excessive nitrates, MTBE or other contaminants. Cal Water's Salinas District capital improvement program is separate from and will not include costs associated with the water system required for the Central Area Specific Plan.

Comparison of Supply and Demand

SB 610 requires an assessment as to whether the proposed water supply for Cal Water's ½ of Central SPA will meet projected water demand for the next 20 years during:

1) A normal water year
2) A single dry year
3) Multiple dry water years

Figure 5 compares annual rainfall since 1980 to the average annual rainfall is shown in below. Average annual rainfall for the Salinas District is 14.6 inches. One of the driest years occurred in 1999 when the rainfall was 79.5% of average (11.6 inches). This is taken as the single dry year. The three multiple dry-water years used in the UWMP were based on the consecutive lowest annual rainfall totals which occurred in 2002, 2003, 2004. Reduced rainfall in Salinas during this period coincides with similar reductions experienced elsewhere in California.

Figure 5: Salinas Comparison of Annual Rainfall to Historical Average

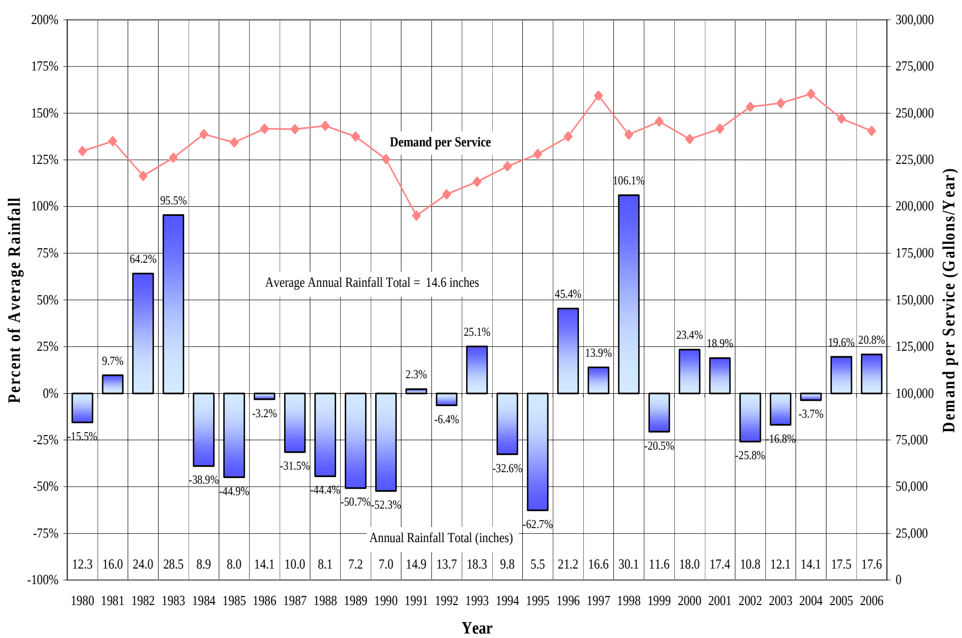

Table 8 provides a comparison of rainfall and water use records for all customer classes combined for the Salinas District. It shows a correlation between amount of annual rainfall and water use by all customer services.

Table 9: Salinas District Rainfall Vs Customer Service Use				
	Rainfall	Rainfall	Gal/day	Classification of Year By
Year	(inches)	% of Ave*	All Services	Amount of Precipitation
1991	14.9	2.1	535	Normal
1992	13.7	-6.2	566	Slightly below Normal
1993	18.3	25.3	584	Above Normal
1994	9.8	-32.9	607	Dry
1995	5.5	-62.3	625	Very Dry
1996	21.2	45.2	651	Well Above Normal
1997	16.6	13.7	711	Slightly below Normal
1998	30.1	106.2	654	Excessively Above Normal
1999	11.6	-20.5	673	Dry
2000	18	23.3	647	Above Normal
2001	17.4	19.2	662	Above Normal
2002	10.8	-26.0	694	Dry
2003	12.1	-17.1	700	Dry
2004	14.1	-3.4	713	Normal
2005	17.5	19.9	677	Above Normal
2006	17.6	20.5	664	Above Normal

*Average Annual Rainfall: 14.6 inches

Following are some highlights from Table 8:

- In 1999, with rainfall 20.5% below normal, average consumption was 673 gallons/day/service;
- In 2000, with rainfall 23.3 % above normal, average consumption was 647 gallons/day/service;
- In 2001, with rainfall 19.2 % above normal, average consumption was 662 gallons/day/service;
- In 2002, with rainfall 26 % below normal, average consumption was 694 gallons/day/service;
- In 2003, with rainfall 17.1 % below normal, average consumption was 700 gallons/day/service;
- In 2004, with rainfall only 3.4 % below normal, average consumption was 713 gallons/day/service.

For single dry years (1999) and multiple dry years (2002, 2003, 2004) there are changes in average water use with respect to what might be considered a “normal” hydrologic year. For example, the average water use for the two years with above normal rainfall (2000 and 2001), average use was 655 gpd/service. For the three dry years (2002, 2003 and 2004), average use was 702 gpd/service or an average of 7.1% increase in water use

While multiple dry years would result in a decline in ground water levels, the effect historically has not reduced the capacity of Cal Water’s wells to meet service area demands. Ground water, as previously shown has recovered in wet years resulting in a relatively stable groundwater supply over decades.

Normal Hydrologic Year

Table 10 presents the supply capacity versus demand for a normal hydrologic year. It conservatively assumes no change in supply capacity even though Cal Water's well replacement and new construction projects will be planned to increase well design capacity. Realistically, a 15% increase in capacity could be expected in the next 20 years so that the 2035 design capacity would be 57,500 AFY or the difference in supply capacity and demand would be 32,725 AFY

Table 10: Normal Hydrologic Year: Supply Capacity Versus Demand (AFY)

Year	Supply	Demand	Difference
2015	50,000	20,053	29,947
2020	50,000	19,911	30,089
2025	50,000	21,374	28,626
2030	50,000	22,931	27.069
2035	50,000	24,589	25,411

Single Dry Year

Based on preceding data and analysis, Cal Water estimates that the availability of its groundwater supplies will not be affected by a single dry year. As the data shows, single dry year demand will very likely be the same as a normal hydrologic year demand. While some customers may increase landscape irrigation due to reduced precipitation, others based on water use advice and information from Cal Water may reduce consumption.
Therefore, Table 11 is the same as Table 10.

Table 11: Single Dry Year: Supply Capacity Versus Demand (AFY)

Year	Supply	Demand	Difference
2015	50,000	20,053	29,947
2020	50,000	19,911	30,089
2025	50,000	21,374	28,626
2030	50,000	22,931	27.069
2035	50,000	24,589	25,411

Multiple Dry Years

Based on preceding data and analysis, Cal Water estimates that the availability of its groundwater supplies will not be significantly affected by a multiple dry year drought. The effect of pumping groundwater supplies that underlie the Salinas District at "normal" demand levels during multiple dry years is very likely some localized area decline in groundwater levels. As groundwater level data presented in this WSA have shown, during ensuing wet periods, groundwater levels are very likely to recover to "normal" levels providing overall Salinas area pumping rates remain the same or do not significantly increase.

Nonetheless, it is conservatively assumed here that in the 2nd or 3rd year of a multiple dry year period that a temporary decline in groundwater levels will reduce the overall yield of Cal Water's wells by 10% and that demand will increase by 7% - not withstanding an intensified water conservation message from Cal Water, MCWRA and other agencies. Table 12 compares supply versus normal demand with these assumptions.

Table 12: 2nd and 3rd Dry Years: Supply Capacity versus Demand (AFY)

Year	Supply	Demand	Difference
2015	46,500	21,457	25,043
2020	46,500	21,304	25,196
2025	46,500	22,870	23,630
2030	46,500	24,536	21,778
2035	46,500	26,310	20,190

The design supply capacity in 2035 is more likely to be 57,500 AFY so that a 10% decline in well yield would result in a supply capacity of 51,750 AFY and a difference of 25,440 AFY between increased demand and reduced supply.

Water Supply Assessment Conclusion

Based on:

- Cal Water's plan to construct a new well with at least 1,000 gpm capacity in its ½ of the Central SPA,
- Cal Water's ability to supply water to its ½ of Central SPA with nearby wells within the City of Salinas,
- Cal Water's short and long term plans to increase supply through increasing well capacity through new or rehabilitated wells or additional treatment facilities
- Cal Water's successful historical experience in fully meeting water demands during single dry years and multiple dry years,
- Cal Water's in-place, ongoing and expanded water conservation programs for reducing demand during normal, single and multiple dry years,
- Cal Water's ability to supply water to City of Salinas' proposed growth areas with water from wells entirely within its Salinas service area,
- Cal Water's ability to move water between pressure zones to where it is needed most through its distribution system (transmission, storage facilities),

Cal Water believes it will have adequate water supplies to meet the projected demands of its ½ of Central Area SPA in addition to those of its existing customers and other anticipated future water users in the Salinas District for the 20 year period from 2015 to 2035 under normal, single dry year and multiple dry year conditions.

ALCO WATER SERVICE
WATER SERVICE ASSESSMENT

INTRODUCTION

From the information provided to Alco Water Service (Alco) by the City of Salinas and the City’s consultants, P&D Consultants, specifically in their report entitled City of Salinas North Future Growth Area Water System Study dated August 30, 2006 (see attached report), the entire Central Area would represent approximately 3,377 additional dwelling units and approximately 633 developable acres to be completed over the next twenty years. The purpose of this Water Service Assessment (WSA) is to present water service information using the methodology to project water use/demand calculations that is consistent with the 150 gallons per person per day specified in the P&D Consultants Water System Study dated August 30, 2006.

BACKGROUND

Alisal Water Corporation, dba Alco Water Service (Alco), is a privately owned public utility that began serving water in 1932 in an unincorporated area commonly referred to as the Alisal. This area was annexed to the City of Salinas in the early 1960's. With the incorporation of the Alisal area, all water served within the city boundaries is provided by public utility water companies.

Alco is governed by the California Public Utilities Commission (CPUC), which regulates water rates and quality of service. The CPUC also retains authority over water quality. Water quality is regulated by the State Water Resources Control Board (SWRCB) Division of Drinking Water and the Monterey County Health Department (MCHD) Environmental Health Division (EHD).

The CPUC is the State regulatory agency responsible for establishing certificated service areas for investor-owned public water utilities such as Alco. Alco has a certificate of public convenience and necessity from the CPUC to provide public utility water service in Monterey County and specifically, in and around the Eastern portion of the City of Salinas. By CPUC Resolution W-4630 dated April 12, 2007, and reaffirmed by CPUC Decision 09-04-035 (D.0905034) dated April 16, 2009, the CPUC authorized Alco to add territory to its certificated service area which includes portions of the Central Future Growth Area, all of the Eastern Future Growth Area and additional unincorporated areas. In D.0904035, the CPUC determined that Alco could adequately provide water service to the future growth areas and authorized Alco to do so. Additionally, Alco has a water supply permit from SWRCB to act as a public water supplier in Monterey County, specifically in the Eastern portion of the City of Salinas.

ALCO'S SOURCE OF SUPPLY

Water Rights

Alco obtains all its water from groundwater. This groundwater is extracted from the Salinas Valley Groundwater Basin and, more specifically, the East Side Aquifer Subbasin. The groundwater in the Salinas Valley Groundwater Basin, which includes the East Side Aquifer Subbasin, is not currently adjudicated, meaning that there are no specific restrictions on the amount of groundwater that can be pulled from any sources as long as it is for beneficial use and is not wasteful. Because the Salinas Valley Groundwater Basin is not an adjudicated basin, Alco has no limit on its legal right to withdraw water from its groundwater well sources and provide that water for the beneficial use of its customers. Further, because Alco is a public utility with a certificate of public convenience and necessity and a SWRCB water supply permit, Alco has the ability and the right to draw water, without limitation, from its water sources for beneficial use to the fullest extent of which it is capable, as long as water is not wasted nor used unreasonably. In California, in an unadjudicated basin, the use of groundwater is governed by the doctrine of correlative rights. This doctrine accords each owner of land overlying a common water supply a right to the reasonable, beneficial use of that water supply. By virtue of this doctrine, coupled with the possession of a certificate of public convenience and necessity from the CPUC and a water supply permit from SWRCB, Alco has the right to withdraw water from its water sources and supply all of those customers that it is approved to serve water to by the CPUC. If, in the future, the Salinas Valley Groundwater Basin were to be adjudicated, Alco, as a public utility providing water service for domestic purposes, would still be considered the highest priority use and would be provided a priority in the adjudication over non-domestic uses, in accordance with CA Water Code 106.

Alco's Groundwater Wells

Alco has been using water from East Side Aquifer Subbasin since 1932 to supply water to its Salinas customers. Alco currently has nine water wells, six of which are in active service and three of which have been designated as standby sources by SWRCB and will be returned to active status after the addition of treatment or blending facilities for arsenic. Alco currently has one new water source already drilled and test-pumped and will be adding this source to the system in the near future. Alco is also in the process of drilling one new water source and projects that it will add the new source to the water system in year 2015. The locations of Alco's existing water sources as well as those wells that are being added in the future are dispersed throughout Alco's service area. As Alco adds additional customers and the total water system demand increases through developments like those projects included in the Central Future Growth Area, Alco will also add additional water well sources as necessitated by that increased total water system demand. The timing of the addition of additional water well sources are estimated in this WSA but will be installed as future water demands require, dependent on future growth.

Alco's existing nine sources, as well as those new sources that are drilled and/or are scheduled to be drilled, draw water from both the 400-foot aquifer and the deep aquifer. Only one well, out of all of Alco's existing well sources and the wells currently being developed, draws water from the 400-foot aquifer only.

Groundwater Supply - Bulletin 118

In Bulletin 118, the Department of Water Resources identifies the Eastside Aquifer Subbasin as follows:

> Basin Boundaries and Hydrology
> The Eastside Aquifer subbasin extends from approximately five miles north of the City of Salinas to twenty-five miles south to the town of Gonzales. The Subbasin is bounded to the north by the Pleistocene Aromas Red Sands of the Salinas Valley-Langley Area Subbasin. To the south, the subbasin shares a boundary with Quaternary Alluvium and Terrace deposits of the Salinas Valley-Lower Forebay Aquifer Subbasin. The western subbasin boundary generally coincides with the northeastern limit of confining conditions in the adjacent 180/400-Foot Aquifer subbasin (DWR 1946a) and with the location of Highway 101. The eastern boundary is the contact of Quaternary Terrace deposits with granitic rocks of the Gabilan Range. The subbasin boundaries are generally correlative with those of the East Side subarea of the Monterey County Water Resources Agency (MCWRA). Intermittent streams such as Natividad, Alisal, Quail, Parsons, Muddy and Johnson Creeks drain the western slopes of the Gabilan Range and flow across the Subbasin toward the Salinas River on the west side of the Valley. Average annual precipitation is 13 inches.
>
> Hydrogeologic Information
> The Salinas Valley is surrounded by the Gabilan Range on the east, by the Sierra de Salinas and Santa Lucia Range on the west, and is drained by the Salinas River, which empties into Monterey Bay on the north. The King City (Rinconda-Reliz) Fault (Durbin 1978) generally follows the western margin of the Valley from King City in the south to Monterey Bay in the north. Valley-side down, normal movement along the fault allowed the deposition of an asymmetric, westward thickening alluvial wedge. The Salinas Valley has been filled with 10,000 to 15,000 feet of Tertiary and Quaternary marine and terrestrial sediments that include up to 2,000 feet of saturated alluvium (Showalter 1984). Above the generally non-water bearing and consolidated granitic basement, Miocene age Monterey and Pliocene age Purisima Formations are water bearing strata within the Plio-Pleistocene age Paso Robles Formation and within Pleistocene to Holocene alluvium.
>
> Water Bearing Formations
> The primary water-bearing units of this subbasin are the same units that produce water in the adjacent 180/400-Foot Aquifer subbasin – namely, the 180-Foot Aquifer and the 400-Foot Aquifer. However, the near-surface confining unit (Salinas Aquitard) does not

extend into the Eastside or other subbasins. Groundwater in the Eastside Aquifer subbasin is semi-confined to unconfined and occurs in lenses of sand and gravel that are interbedded with massive units of finer grained material (Durbin 1970). The thickness of the 180-foot aquifer varies from 50 to 150 feet in the Salinas Valley, with an average 100 feet (MW 1994; DWR 1970). Because of the westward thickening of alluvial units in the Salinas Valley (Showalter 1984), the average thickness in the Eastside subbasin is probably less than that stated above. The 180-Foot Aquifer may be in part correlative to older portions of Quaternary terrace deposits or the upper Aromas Red Sands. The 180-Foot Aquifer is separated from the 400-Foot Aquifer by a zone of discontinuous sands and blue clays called the 180/400-foot Aquiclude (MW 1998) which ranges in thickness from 10 to 70 feet.

More recent studies suggest the 400-Foot Aquifer exist not only in the 180/400-Foot Aquifer subbasin, but also in the Eastside Aquifer and Lower Forebay Aquifer subbasins (MW 1994). The 400-foot aquifer has an average thickness of 200 feet and consists of sands, gravels, and clay lenses (LHI 1985). The upper portion of the aquifer may be correlative with the Aromas Red Sands and the lower portion with the upper part of the Paso Robles Formation (MW 1994).

Later reports term the 180-Foot Aquifer and the 400-Foot Aquifer the “shallow zone” and “deep zone”, respectively, in the Eastside and in the Upper and Lower Forebay subbasins (MW 1998).

An additional, deeper aquifer (also referred to as the 900-Foot Aquifer or the Deep Aquifer) is present in the lower Salinas Valley. A blue marine clay aquitard also separates this aquifer from the overlying 400-Foot Aquifer. This deeper aquifer consists of alternating layers of sand-gravel mixtures and clays (up to 900 feet thick), rather than a distinct aquifer and aquitard (MW 1994). The Deep Aquifer has experienced little development except near the coast where it is used to replace groundwater from the 180- and 400-Foot Aquifers rendered unusable by seawater intrusion; water quality and yield data are scarce.

MW (1994) estimated specific yields for the three main aquifers in the Salinas Valley for their Integrated Ground and Surface Water Model (IGSM). The estimated values for the 180-Foot, 400-Foot, and Deep Aquifers were 8-16 percent, 6 percent, and 6 percent, respectively. An average weighted specific yield of 8.8 percent was derived for three depth zones within the interval 20 to 200 feet below grade by the SWRB (1955). Yates (1988) estimated a storage coefficient of 0.0285 in the northern subbasin and 0.030 in the southern subbasin.

DWR Bulletin 118 further states;

Groundwater Budget (Type A)

A detailed groundwater budget was available for this subbasin for 1994 (MW 1998). Natural recharge (including applied water recharge) is estimated to be 41,000 af. There is no artificial recharge. Subsurface inflow is approximately 17,000 af. Annual urban and agricultural extractions total 86,000 af. There are no other extractions or subsurface outflow.

Therefore, according to the above information provided by Bulletin 118, this Subbasin is in overdraft of approximately 28,000 af per year. Bulletin 118 also states that, as of 1994, the Eastside Aquifer Subbasin had approximately 2,560,000 af of groundwater stored in this Subbasin. As of 1994, there were approximately 91.4 years of water available in this Subbasin (2,560,000 af / 28,000 af of overdraft per year = 91.4 years. Therefore, according to Bulletin 118's documentation, if no steps whatsoever were taken to address the overdraft issues of the Eastside Aquifer Subbasin, there would still be approximately 71 years of capacity as of 2014 in the Eastside Aquifer Subbasin.

Groundwater Management Legislation

On September 16, 2014, Governor Brown signed legislation requiring stricter management of the State's groundwater supply. The legislation, specifically SB1168, SB1319 and AB1739, will require the Department of Water Resource to categorize each groundwater basin (such as the Salinas Valley Groundwater Basin) as high-, medium-, low-, or very low priority and would require the initial priority for each basin to be established no later than January 1, 2015.

By January 31, 2020, all basins designated as high- or medium-priority basins by the department that have been designated in Bulletin 118, as may be updated or revised on or before January 1, 2017, as basins that are subject to critical conditions of overdraft shall be managed under a groundwater sustainability plan or coordinated groundwater sustainability plans pursuant to this part.

The Legislature encourages and authorizes basins designated as low- and very low priority basins by the department to be managed under groundwater sustainability plans pursuant to this part. Chapter 11 (commencing with Section 10735) does not apply to a basin designated as a low- or very low priority basin.

This legislation would additionally authorize the state board to designate certain high- and medium-priority basins as a probationary basin if, after January 31, 2025, prescribed criteria are met, including that the state board determines that the basin is in a condition where groundwater extractions result in significant depletions of interconnected surface waters.

Due to this new state legislation, Alco believes that the Salinas Valley Groundwater Basin will be brought into equilibrium and that future long term overdraft will be eliminated. This will be accomplished either through a locally (Monterey County) adopted and managed groundwater sustainability plan or a State mandated and administered groundwater sustainability plan. In either case, Alco expects the overdraft within the Salinas Valley Groundwater Basin to be eliminated.

Monterey County already has an agency developing projects to reduce the overdraft in the Salinas Valley Groundwater Basin; this agency is the Monterey County Water Resources Agency.

Monterey County Water Resources Agency

Monterey County has established an agency called the Monterey County Water Resource Agency (MCWRA) in order to address water shortage issues in the basin. MCWRA manages two distinct water projects, the Castroville Seawater Intrusion Project (CSIP) and the Salinas Valley Water Project (SVWP). The goals of these projects are to stop seawater intrusion, provide adequate water supplies to meet current and future (2030) needs and hydrologically balancing the groundwater of the Salinas Valley Groundwater Basin.

Castroville Seawater Intrusion Project (CSIP) / Salinas Valley Recycling Project (SVRP)

The CSIP / SVRD is a jointly managed and operated project of the Monterey Regional Water Pollution Control Agency (MRWPCA) and the Monterey County Water Resources Agency (MCWRA), completed in 1997. MRWPCA provides residential wastewater treatment for the Salinas urban area and, after treatment, recycles 100% of the treated effluent for agricultural irrigation in the northern Salinas Valley in the summer months. This recycled water program has the ability to provide approximately 30,000 AFY, which reduces groundwater used from the Salinas Groundwater Basin for agricultural purposes.

Salinas Valley Water Project (SVWP)

The SVWP is a collaborative effort between MCWRA and Salinas Valley interests to address the water resources management issues within the Salinas Valley. The SVWP provides for the long-term management and protection of groundwater resources in the basin. The SVWP was developed to address three critical water supply, water distribution and water quality issues in the Salinas Valley:

1) Stopping seawater intrusion
2) Providing adequate water supplies and flexibility to meet current and future (2030) needs
3) Hydrologically balancing the groundwater basin in Salinas Valley

To address the three issues, the SVWP proposes:

- Modifying the spillway at Nacimiento Dam and reporting Nacimiento and San Antonio Reservoirs; and

- Diverting the Salinas River at Marina and transferring water to CSIP (completed in 2010); and
- Utilizing the Salinas River for conveying water to the northern portion of the Salinas Valley; and
- Interlake Tunnel Project

MCWRA describes these projects as follows in its Project Description dated January 2001:

Modification to the Nacimiento Dam spillway.
The spillway at Nacimiento Dam would be modified to increase the flexibility of reservoir operations and allow the reservoir to maintain higher water levels in the winter and spring months. The additional storage gained at Nacimiento would be released along with flows stored at San Antonio Dam for Basin recharge and diversion later in the year. The Modifications to the Nacimiento Dam Spillway were completed in 2009.

Reoperation of Reservoirs.
The proposed spillway modifications would change the ways Nacimiento and San Antonio reservoirs are operated in order to provide the source water for the SVWP, while assuring the provision of adequate flood control capacity. The modified operation would increase the amount of water available for recharge and diversion during the irrigation season. This project was completed in 2009.

Salinas River Recharge, Conveyance, Diversion and Distribution.
The Salinas River would be utilized to convey water to the proposed diversion facility. The facility would include an inflatable dam designed to operate from April to November. A proposed Salinas River surface diversion facility would divert river water to the existing Castroville Seawater Intrusion Project (CSIP) system for delivery to the CSIP service area for agricultural irrigation. Diverted river water would supplement the use of CSIP project water and would replace existing groundwater pumping in the CSIP service area. The diversion facility would form a shallow impoundment of water upstream of the facility when the dam is operational. This impoundment could extend up to 2 miles upstream.

Diversion Facility
The proposed surface diversion facility would divert up to 25,000 acre feet of water from the Salinas River at Salachi Ranch Road into the existing CSIP distribution pipeline for delivery to agricultural users for irrigation. The diverted water would serve as an alternate groundwater supply to offset groundwater pumping. San Antonio and Nacimiento reservoirs would be reoperated to release water primarily during the late-spring and summer irrigation season. Increased spring and summer flows would be available for diversion to agricultural users via the surface diversion facility. Increased flows would also provide increased recharge through the riverbed to the groundwater aquifer. This project was completed in 2010.

East Side Canal Intake & Castroville Canal Intake
The Project will allow MCWRA to facilitate further offsets of groundwater pumping by delivering additional surface water to the Pressure and East Side subareas. In accordance with the Technical Memorandum prepared by GEOSCIENCE Support Services, Inc. and released to

the public in November 2013, up to 135,000 acre-feet per year of water will be diverted from the Salinas River and supplied for municipal, industrial, and/or agricultural uses in the Pressure and East Side subareas. Two pipelines will be constructed to deliver the water to end-users. Continued alleviation of groundwater pumping through use of the diverted surface water will help combat seawater intrusion in Monterey County.

The Project will encompass two surface water diversion points and their appurtenant facilities for capture, conveyance, and delivery of the water.

Capture and Diversion

The capture and diversion facilities will consist of either a surface water diversion facility, similar to the SRDF, or Ranney® Collector Wells. The most appropriate type of facility for each diversion point will be examined in the EIR.

Conveyance

The conveyance facilities associated with each diversion point will be composed of pipelines, which may be constructed both above and below ground level, and pump stations. The Project EIR will be used to analyze the most beneficial configuration of the pipelines and to explore specifics of the pipelines, including diameter, length, destination, number and location of turnouts, locations of pump stations, and physical layout of the conveyance facilities.

Delivery

The type and locations of the Project’s delivery facilities will be analyzed in the EIR to determine maximum beneficial use of the water. The resulting delivery facilities may consist of injection wells that are part of an aquifer storage and recovery (ASR) system, percolation ponds, turnouts for direct use of the water, or other options ensuing from analysis during the EIR process. The construction design and physical location of the delivery facilities will be influenced by the type of facility, the end-user’s intended application of the water (agricultural versus urban), and whether or not the Project will involve a water treatment component. The Project will either deliver raw water or treated water; if treated, the method of treatment will be identified once a project alternative is selected.

<u>System Operations</u>

The SVWP diversion facility will be operated to complement existing recycled water flows. Recycled water plant flows will be blended with Salinas River water whenever river diversions are available. The existing supplemental wells that provide groundwater to the CSIP system will be maintained. These wells will be utilized to provide peak irrigation flow requirements as well as to provide an adequate irrigation water supply during dry year conditions when Salinas River diversions are not adequate to meet the irrigation demand of the CSIP service area.

<u>Interlake Tunnel Project</u>

MCWRA is currently seeking funding to build a water conveyance tunnel between Nacimiento Reservoir and San Antonio Reservoir. The Nacimiento Reservoir fills approximately three times faster than the San Antonio Reservoir and, if built, would allow for an additional 60,000 acre-feet of water to be stored annually. If MCRWA’s current timeline is followed, this project could be constructed by the end of 2016.

ALCO'S WATER CONSERVATION EFFORTS IN ITS EXISTING SYSTEM

SB X7-7

In November of 2009, the State of California passed Senate Bill (SB) X7-7, requiring a reduction of per capita urban water use by 20% by December 31, 2020, using 2005 per capita water usage as a baseline.

In order to meet the goals set by SB X7-7, Alco was authorized in its last CPUC proceeding to implement a water conservation program. This program included a tiered rate structure, provision of water conservation kits, performance of individualized leak surveys at customers' requests, and provision of water conservation educational materials. The program has been successful and has led to a reduction of 12.55% of per capita water usage (gallons per capita per day = GPCD) for calendar year 2013, based on Alco's historical water usage date from the baseline year 2005. Alco will use its best efforts and fully expects to meet the 20% reduction in GPCD by December 31, 2020. In the tables and calculations contained in this WSA, Alco's projected water demand from its existing water system takes into account the water conservation efforts and the 20% reduction in GPCD by 2020.

Voluntary Conservation Measures

In addition to the above efforts, on January 17, 2014, Governor Brown issued a Statewide Drought State of Emergency and ordered State agencies to implement "a Statewide water conservation campaign to make all Californians aware of the drought and encourage personal actions to **reduce water usage** … **by 20%**".

Additionally, on April 25, 2014, Governor Brown issued an Executive Order "strengthen the State's ability to manage water and habitat effectively in drought conditions and called on all Californians to redouble their efforts to conserve water."

In response to the Governor's proclamation of the Drought State of Emergency, the California Public Utilities Commission (CPUC), the agency that regulates public utility water companies like Alco, issued its own Resolution (Res. No. W-4976), which prescribes the process to establish Tariff Rule 14.1, by which water utilities can introduce voluntary conservation measures, and Schedule 14.1, which provides for mandatory rationing if voluntary measures do not yield the necessary reduction in consumption, or in circumstances of prolonged or severe drought."

In response to the Governor's orders and to the requirements of the CPUC, Alco has formally notified the CPUC that it is activating its existing Tariff Rule 14.1 (Voluntary Water Conservation Measures) and sent notification to all of its customers to voluntarily reduce their water use by 20%. Alco also notified the CPUC that it is ready to comply with future directives under the Governor's Emergency Drought Declaration for either additional voluntary conservation measures or requirements for mandatory rationing.

SWRCB Emergency Regulations

Most recently, the CPUC issued its Resolution W-5000 which implements the Emergency Regulation which was adopted by the State Water Resources Control Board (Board) on July 15, 2014, and made effective July 28, 2014. The Board's new regulations, specifically CCR Title 23, Article 22.5 Sections 863 through 865, are a result of Governor Brown's directives to the Board regarding California's extended drought and the regulations specify what Californians must do in order to ensure reliable supplies of water as the drought continues. As a result of the requirements of Resolution W-5000 and the Board's new regulations, Alco sent notification to its customers informing them of the new regulations and the associated potential fines if the new water usage prohibitions are violated.

ALCO'S WATER SYSTEM DEMAND FOR ITS EXISTING WATER SYSTEM

In the tables that follow in this section of the WSA, Alco has shown its 2005 through 2014 actual water demand and percent reduction of the GPCD (see Table 1), as compared to its baseline 2005 historical usage data, and will use the projected reduction for years 2015 through 2020 (see Table 2) that will allow Alco to incrementally arrive at its goal of 20% reduction by December 31, 2020 for projected annual water system demand for its existing system.

THIS AREA INTENTIONALLY LEFT BLANK

Table 1: Alco's Existing Water System Demand for Years 2005 through 2014*

Year	Water Demand (MG/Year)	GPCD	% Reduction**
2005	1556.5	160.88	0.00%
2006	1482.4	145.12	-9.80%
2007	1557.2	154.59	-3.91%
2008	1564	153.58	-4.54%
2009	1539.97	146.40	-9.00%
2010	1497.05	140.69	-12.55%
2011	1458.8	136.28	-15.29%
2012	1421.57	132.77	-17.47%
2013	1,495.81	140.69	-12.55%
2014	1367.75	128.60	-20.07

* 2014 data is from January to September inclusive

** % reduction is based on 2005 baseline GPCD

Table 2: Alco's Existing Water System Projected Water System Demand for Years 2015 through 2020 [1]

Year	Water Demand Alco Only (MG/Year)	Population served [2]	GPCD	% Reduction*
2015	1,376.10	29294	128.70	-20.00%
2016	1,383.85	29459	128.70	-20.00%
2017	1,391.60	29624	128.70	-20.00%
2018	1,399.35	29789	128.70	-20.00%
2019	1,407.10	29954	128.70	-20.00%
2020	1,407.10	29954	128.70	-20.00%

* % reduction is based on 2005 baseline GPCD

[1] These projections do not include the additional projected water demand for the Central Future Growth Area.

[2] Assumes linear growth of 50 homes per year for years 2015 through 2019, a total of 250 homes, due to various planned developments and in-fill in Alco's existing water system.

Alco's Existing Water System: Maximum Day and Peak Hourly Demand

Table 3 shows Alco's current and projected water system Maximum Day Demand (MDD) and Peak Hourly Demand (PHD) for its existing system through year 2020. For years 2011 through 2014, the data is actual data and years 2015 through 2020 are projected.

Table 3: Alco's Existing Water System Maximum Day Demand & Peak Hourly Demand

Year	MDD [3] (gals)	MDD (MG)	PHD (gals)	PHD (GPM)	Population [4] (persons)	MDD/capita (gals/day/person)
2011	6,047,683	6.048	377,980	6,300	29327	**206.22**
2012	5,575,352	5.575	348,460	5,808	29334	190.06
2013	5,559,537	5.560	347,471	5,791	29129	190.86
2014*	5,710,417	5.710	356,901	5,948	29129	196.04
2015	6,040,878	6.041	377,555	6,293	29294	206.22
2016	6,074,903	6.075	379,681	6,328	29459	206.22
2017	6,108,929	6.109	381,808	6,363	29624	206.22
2018	6,142,955	6.143	383,935	6,399	29789	206.22
2019	6,176,980	6.177	386,061	6,434	29954	206.22
2020	6,176,980	6.177	386,061	6,434	29954	206.22

* From January 1 through September 30, 2014, Maximum Day is August 21st and MDD was 5,710,417 gals. While 2014 is not yet over, Alco has never had a Maximum Day in October, November or December of any year.

Calculation of Maximum Day Demand (MDD):

The MDD for years 2011 through 2014 shown in Table 3 are actual recorded data from Alco's Supervisory Control and Data Acquisition (SCADA) system. The MDD per capita for these four years was determined by dividing the MDD by the population served per year.

The projected MDD for years 2015 through 2020 were determined by taking the highest MDD per capita from the actual recorded data, which is 206.22 gals/day/person, and multiplying it by the projected population served for years 2015 through 2020, from Table 2.

Calculation of Peak Hourly Demand (PHD):

After calculating MDD, the PHD was then calculated by determining the average hourly flow during MDD and multiplying by a peaking factor of 1.5 to obtain PHD.[5] In Table 3, the

---

[3] The MDD for years 2011 through 2014 are actual, as recorded, MDDs for Alco's existing water system. The MDD for years 2015 through 2020 are calculated from projected population and the highest recorded MDD/capita.

[4] The population for years 2011 through 2014 is the recorded population served. The population for years 2015 through 2019 assume linear growth of 50 homes per year for these years, a total of 250 homes due to various planned developments and in-fill in Alco's existing water system. Year 2020 assumes the same population as year 2019.

PHD is shown in both total gallons required and the equivalent of gallons per minute (during this hour of peak use).

WATER DEMAND OF CENTRAL FUTURE GROWTH AREA PROJECT

By letter dated September 22, 2006, the City of Salinas has determined that the appropriate water demand for the Central Area will be 150 gallons per person per day multiplied by 3.67 persons per dwelling. This water demand was shown in the Administrative Draft of the City of Salinas North Future Growth Area Water System Study prepared by P&D Consultants on August 30, 2006.

The Table below, showing water demand for the Central Area, was taken directly from P&D's Water System Study prepared for the City of Salinas and will be used in Alco's current Water Service Assessment to demonstrate water demand. The Table, including the notes below it, demonstrates that the Central Specific Plan Area adds approximately 2.0 million gallons per day of water demand to the system.

Table 4: TABLE 6 from P&D Consultants' August 30, 2006 Water System Study

Water Demand for the Central Specific Plan Area

Development	Units	Generation Rates (GPD)	Quantity	Average Water Demand (GPD)	Average (GPM)
Low Density	DU	550	1,765	971,632.5	675
Medium Density	DU	550	1,348	742,074	515
High Density	DU	550	201	110,650.5	77
Retail	Acre	3,000	0	0	0
Office	Acre	3,000	0	0	0
Mixed Use	Acre	3,000	21	63,000	44
Parks	Acre	1,500	26	39,000	27
Schools	Acre	1,500	44	66,000	46
Total				1,992,397	1,384

DU = Dwelling Unit
GPM = Gallons Per Minute
GPD = Gallons Per Day

Maximum Day Demand Peaking Factor 2
Maximum Day Demand 2,767 GPM
Peak Hour Demand Peaking Factor 4
Peak Hour Demand 5,534 GPM

[5] Pursuant to California Code of Regulations Title 22 Section 64554(b)(1).

Central Future Growth Area: Maximum Day Demand and Peak Hourly Demand:

Using the data from P&D Consultants' Water System Study dated August 30, 2006, the anticipated peak flows for the Central project from the City of Salinas' specific plan are as follows:

Table 5: Central Future Growth Area Project Maximum Day and Peak Hourly Demand [6]

PROJECT	MAXIMUM DAY DEMAND (GPM)	PEAK HOURLY DEMAND (GPM)
CENTRAL	2,767	5,534

These hourly peak flows are generally expressed in GPM to compare it readily with the pumping capacity of the system.

Table 6, below, is a summary of the data obtained from the Total Project Water Demand from the Water System Study prepared by P&D Consultants on August 30, 2006. The data is either directly from P&D's data or is calculated using P&D's data: For example, the Table from P&D Consultants' August 30, 2006 Water System Study provides a Maximum Day Demand of 2,767 GPM. To calculate this in gallons, you would multiply 2,767 GPM x 60 minutes x 24 hours = 3,984,480 gallons, as shown in Table 6. Similarly, the Table from P&D Consultants' August 30, 2006 Water System Study provides a Peak Hourly Demand of 5,534 GPM. To calculate this in gallons, you would multiply 5,534 GPM x 60 minutes x 24 hours = 332,040 gallons, as shown in Table 6.

Table 6: Central Future Growth Area Project Water Demand

Area	Dwelling Units [7]	Daily Water Demand (MG/day) [8]	Annual Water Demand MG/year	Maximum Day Demand (gals)	Peak Hourly Demand (gals)	Peak Hourly Demand (GPM) [9]
CENTRAL	3,377	1.992397	727	3,984,480	332,040	5,534

[6] These demands in GPM include the anticipated demand from the expected residential, irrigation, commercial and industrial uses for the Central Area of development.
[7] From P&D Consultants' Table 6 (Table 4 in this document).

TOTAL SYSTEM WATER DEMAND: ALCO'S EXISTING SYSTEM PLUS CENTRAL FUTURE GROWTH AREA PROJECT

Table 7, below, shows the projected incremental annual water demand of Alco's existing water system plus the incremental annual demand for the Central Future Growth Area project and the total annual water system demand (existing system demand plus project demand) for years 2015 through 2034.

This time period was chosen assuming, for the purposes of this WSA, that the Central Future Growth Area will begin development in year 2015 and that the water demand will increase linearly for the following 20 years until the project is complete.

THIS AREA INTENTIONALLY LEFT BLANK

Table 7: Projected Annual Total Water System Demand for Years 2015 through 2034

Year	Water Demand Alco Existing Water System [10] (MG/Year)	Demand due to Central [11] (MG/Year)	Total Alco + Central Demand (MG/Year)
2015	1,465.73	36.35	**1,502.08**
2016	1,456.62	72.70	**1,529.32**
2017	1,447.33	109.05	**1,556.38**
2018	1,437.83	145.40	**1,583.23**
2019	1,428.15	181.75	**1,609.90**
2020	1,410.52	218.10	**1,628.62**
2021	1,410.52	254.45	**1,664.97**
2022	1,410.52	290.80	**1,701.32**
2023	1,410.52	327.15	**1,737.67**
2024	1,410.52	363.50	**1,774.02**
2025	1,410.52	399.85	**1,810.37**
2026	1,410.52	436.20	**1,846.72**
2027	1,410.52	472.55	**1,883.07**
2028	1,410.52	508.90	**1,919.42**
2029	1,410.52	545.25	**1,955.77**
2030	1,410.52	581.60	**1,992.12**
2031	1,410.52	617.95	**2,028.47**
2032	1,410.52	654.30	**2,064.82**
2033	1,410.52	690.65	**2,101.17**
2034	1,410.52	727.00	**2,137.52**

[10] For years 2015 through 2020, Alco's existing system annual water demand is projected to reduce, as was shown in Table 2, due to the incremental reduction to achieve a total of 20% reduction by 2020 per SB X7-7. After 2020, the water demand is projected to remain the same for Alco's existing system.

[11] This is the incremental annual water demand for the Central Future Growth Area, assuming the project begins in 2015 and is completed at full build-out in 2034.

Table 8: Projected Total Water System Maximum Day Demand and Peak Hourly Demand for Years 2015 through 2034

Year	Alco MDD [12]	Alco PHD (GPM)	Central MDD [13]	Central PHD (GPM)	Alco + Central MDD	ALCO + CENTRAL PHD (GPM)

2023	6,176,980	6,434	1,793,016	2,490	7,969,996	8,924
2024	6,176,980	6,434	1,992,240	2,767	8,169,220	9,201
2025	6,176,980	6,434	2,191,464	3,044	8,368,444	9,478
2026	6,176,980	6,434	2,390,688	3,320	8,567,668	9,754
2027	6,176,980	6,434	2,589,912	3,597	8,766,892	10,031
2028	6,176,980	6,434	2,789,136	3,874	8,966,116	10,308
2029	6,176,980	6,434	2,988,360	4,151	9,165,340	10,585
2030	6,176,980	6,434	3,187,584	4,427	9,364,564	10,861
2031	6,176,980	6,434	3,386,808	4,704	9,563,788	11,138
2032	6,176,980	6,434	3,586,032	4,981	9,763,012	11,415
2033	6,176,980	6,434	3,785,256	5,257	9,962,236	11,691
2034	6,176,980	6,434	3,984,480	5,534	10,161,460	11,968

* From January 1 through September 30, 2014, MDD was 5,710,417 gals.

[12] The MDD for years 2015 through 2020 are calculated from projected population (assuming linear growth of 50 homes per year for those years) and the highest recorded MDD/capita. After 2020, the MDD is projected to remain the same for Alco's existing system.

[13] This is the incremental MDD for the Central Future Growth Area, assuming the project begins in 2015 and is completed at full build-out in 2034.

Alco's water system demand, which includes the current demand and the demand projected to the build-out of the project, is within the maximum well capacity of Alco's existing wells, as shown by comparing Tables 8 and 10.

Dry Years

The information provided above is based on normal years. Due to the nature of Alco's water supply being all groundwater, our supply is not as sensitive to dry years as a surface water supplied system. Additionally, due to the fact that our water system does not serve water for agricultural purposes and is mainly for urban use, our water demand does not fluctuate significantly with dry and multiple dry years, see Table 9 below.

Table 9: Water Demand Per Service Connection
For Normal, Single Dry & Multiple Dry Years
1970 through 2013

Years	Water System Demand Per Service Connection [14] Per Year (Gallons)	% Difference From 45-Year Average
1970 through 2013	189,000	N/A
Single Dry Year (2013)	160,000	-15.34
Multiple Dry Years (2007 through 2009)	172,000	-8.99

As can be seen from Table 9 above, the average water demand in a single dry year, which is represented by the average water demand during the 2013 drought[15], is 15.34% lower than Alco's historical water demand per service connection per year. We have used the 2007-2009 drought as an example of multiple dry years and, as can be seen by the Table, the average water demand for these years was only 8.99% greater than Alco's historical water demand per service connection per year. Therefore, Alco's system has not historically experienced an increase in water demand in normal, single dry and multiple dry years; in fact, Alco has seen a decrease in these years.

During single dry years and multiple dry years, Alco's historical data has not shown an increase in the per capita water demand.

[14] Number of Service Connections includes all categories; single-family residential, multi-family residential, commercial, industrial, institutional, landscape irrigation.
[15] The 2013 drought is the driest calendar year on record for the State of California.

Alco's groundwater wells have proven to be a reliable source of water for its service area. During the major droughts of 2013 and 2007-2009, Alco's water capacity did not diminish and the water wells continued to constitute a reliable supply during single and multiple dry years. The wells that provided water during this time period continue to provide a reliable source of water. Additionally, newer wells pumping from the same aquifers have proven to provide adequately during single dry and multiple dry years. Furthermore, the Central area is currently irrigated agricultural areas, which, when converted to urban uses, are expected to draw less water from the aquifer than in the past or at least be water-neutral, impacting the aquifer neither positively nor negatively. It is a goal of the Monterey Water Resources Agency to reduce the water consumption by at least 20% during changes of land use (Mulholland, 1993). Therefore, Alco does not expect water usage in the Central Area to increase the water demand on the aquifer.

Further, in the Department of Water Resources Bulletin 160-98, Appendix 5A Regional Water Budgets with Existing Facilities and Programs, Table ES5A-3 shows that, for the Central Coast Region, the urban water use by 1995 calculations for an average year, was 286,000 af and for a drought year was 294,000 af. Table ES5A-3 projected that in 2020, an average year for urban water use would be 379,000 af and a drought year would be 391,000 af. Further, this Table demonstrates that groundwater supplies actually increased in the 1995 calculations from 1,045,000 af to 1,142,000 af. Similarly, the groundwater supply increases for the projected numbers for 2020, from 1,041,000 af to 1,159,000 af. These numbers are intended to represent the entire Central Coast Region, which includes diverse areas. However, comprehensively, the difference in urban water usage does not increase significantly for the entire area and the supply during drought years for groundwater does not diminish. This trend mimics Alco's own historical experience, in prior single and multiple dry years, that has indicated no increases in actual water usage when comparing normal years to dry and multiple dry years.

WATER SUPPLY, PRODUCTION AND IMPLEMENTATION

Water Supply

As discussed previously, Alco's water supply comes entirely from groundwater. The proposed project areas are currently in agricultural use and are supplied from wells drawing groundwater. As also stated previously, the conversion of irrigated agricultural land to residential development generally results in a net decrease in water consumption, thus Alco expects that the provision of water service to the project area will either draw less water from the aquifer or comparable amounts of past usage for the same area. It is a goal of the Monterey Water Resources Agency to reduce the water consumption by at least 20% during changes of land use (Mulholland, 1993). During the past droughts Alco had no problem of meeting its demands and no changes are expected in the future.

Production

Alco's current production capacities of existing wells are as shown below in Table 10:

Table 10: Existing Well Capacities

Existing Wells	Maximum Well Capacity			Existing Pump Capacity [16]		
	GPM	MG/Day	MG/Year	GPM	MG/Day	MG/Year
Active Wells						
Alisal	4,000	5.76	2,102	2,200	3.168	1,156

THIS AREA INTENTIONALLY LEFT BLANK

[16] The production numbers shown for Existing Pump Capacity are the quantities that the existing pumps installed at these wells can produce. Larger pumps can be installed if necessary to obtain Maximum Well Capacity.

[17] The Boronda, Las Casitas and Nogal Wells are standby wells, as designated by the State Water Resources Control Board (SWRCB), and are planned to be returned to active status after the addition of treatment or blending facilities for arsenic.

Table 11: Projected System Well Production Capacity

SOURCE	CAPACITY (in GPM)						
	2013	2014	2015	2020	2025	2030	2034
EXISTING WELLS [18]							
Active Wells	12,350	12,350	12,350	18,650	18,650	18,650	18,650
Standby Wells	6,300	6,300	6,300	-	-	-	-
NEW WELLS [19]							
New Bardin	-	1,500	1,500	1,500	1,500	1,500	1,500
New Laurel Heights	-	-	2,000	2,000	2,000	2,000	2,000
Surrey (MB #2)	-	-	-	2,000	2,000	2,000	2,000
Monte Bella (MB #3)	-	-	-	-	2,000	2,000	2,000
Padova (MB #4)	-	-	-	-	1,000	1,000	1,000
Hibino	-	-	-	-	-	2,000	2,000
RESERVE WELL LOTS [20]							
WR #2							
WR #3							
First Avenue							
Towt Street							
Williams Road							
Wiren Street							
Acosta Plaza							
Ranchero Drive							
Rider Avenue							
Alma Avenue #2							
TOTAL CAPACITY (GPM)	18,650	20,150	22,150	24,150	27,150	29,150	29,150
PEAK HOURLY SYSTEM DEMAND (GPM) [21]	5,791	5,948	6,570	8,094	9,478	10,861	11,968

[18] Alco's three standby wells, Boronda, Las Casitas and Nogal, are planned to be returned to active service by 2020 through treatment or blending for arsenic. Therefore, the capacities of these wells are included in the capacity for the Active Wells beginning in 2020.
[19] Capacity amounts begin in the years that these wells are projected to be put into service. Surrey (MB #2), Monte Bella (MB #3), Padova (MB #4) and Hibino will be added as necessary as water system demand requires, either by, before or after projected dates indicated.
[20] Reserve well lots to be drilled and put into production as necessary as water system demand requires.
[21] From Table 8 in this WSA.

Table 12: Summary - Production Capacities of Existing and Future Wells

Year	Gallons Per Minute	Gallons Per Day	MG/Day	Gallons Per Year	MG/Year
2013	18,650	26,856,000	26.856	9,802,440,000	9,802.440
2014	20,150	29,016,000	29.016	10,590,840,000	10,590.840
2015	22,150	31,896,000	31.896	11,642,040,000	11,642.040
2020	24,150	34,776,000	34.776	12,693,240,000	12,693.240
2025	27,150	39,096,000	39.096	14,270,040,000	14,270.040
2030	29,150	41,976,000	41.976	15,321,240,000	15,321.240
2034	29,150	41,976,000	41.976	15,321,240,000	15,321.240

Can Alco's Water Production Facilities Meet the Annual Water System Demand of Its Existing System and the Central Future Growth Area Project?

Yes, as can be seen from Table 7, the Total Annual Water System Demand from Alco's existing system and the Central Future Growth Area at full system build-out (2034) is projected to be 2,137.52 MG/year. Table 10 shows that Alco's existing active wells have a capacity to produce 6,490 MG/year.

As can be seen from the tables, for all time periods indicated, Alco's existing active wells (capacity = 6,490 MG/year) can meet the Total Annual Demand of Alco's existing system and the Central Future Growth Area's Total Annual Demand (2,137.52 MG/year). However, Alco plans to add additional water sources as shown in Table 11 (New Wells) and summarized in Table 12. With these additional wells, Alco will exceed the Total Annual Water System Demand of the combined demand of its existing system plus the Central Future Growth Area project by 13,183.72 MG/Year at the expected full project build-out in 2034.

Can Alco's Water Production Facilities Meet the Maximum Day Demand of Its Existing System and the Central Future Growth Area Project?

Yes, as can be seen from Table 8, the Maximum Day Demand from Alco's existing system and the Central Future Growth Area at full system build-out (2034) is projected to be 10.161 MG. Table 10 shows that Alco's existing active wells have a capacity to produce 17.784 MG/day.

As can be seen from the tables, for all time periods indicated, Alco's existing active wells (capacity = 17.784 MG/day) can meet the MDD of Alco's existing system and the Central Future Growth Area's MDD (10.161 MG). However, Alco plans to add additional water sources as shown in Table 11 (New Wells) and summarized in Table 12. With these additional wells, Alco will exceed the MDD of the combined demand of its existing system plus the Central Future Growth Area project by 31.815 MG/day at the expected full project build-out in 2034.

Can Alco's Water Production Facilities Meet the Peak Hourly Demand of Its Existing System and the Central Future Growth Area Project?

Yes, as can be seen from Table 8, the Peak Hourly Demand from Alco's existing system and the Central Future Growth Area at full system build-out (2034) is projected to be 11,968 GPM. Table 10 shows that Alco's existing active wells have a capacity to produce 12,350 GPM.

As can be seen from the tables, for all time periods indicated, Alco's existing active wells (capacity = 12,350 GPM) can meet the PHD of Alco's existing system and the Central Future Growth Area's PHD (11,968 GPM). However, Alco plans to add additional water sources as shown in Table 11 (New Wells) and summarized in Table 12. With these additional wells, Alco will exceed the PHD of the combined demand of its existing system plus the Central Future Growth Area project by 17,182 GPM at the expected full project build-out in 2034.

System Reliability and Redundancy

As previously shown, Alco does have the water capacity to meet the annual water demand, the MDD and the PHD of its existing system plus the Central Future Growth Area during normal operation. However, Alco's system for its existing system and for its future system design, takes into consideration extraordinary circumstances which need to be considered for the proper operation of the water system to provide a safe reliable water supply to its customers.

All of Alco's major well sources are equipped with an onsite standby generator with an automatic transfer switch and Alco also has portable standby generators that can be moved to any water facility in need of power. Additionally, all future well and pumping facilities will be designed to be equipped with an onsite standby generator.

Alco's existing wells are located throughout the water system and rely on different parts of the power grid, therefore it is less likely that multiple sources would be affected by power outages. Future wells will be similarly disbursed throughout the water system to decrease the impacts of localized power outages.

Depending upon system demand requirements, Alco has the ability to add additional wells to the water system in order to meet as shown in Table 11. The timeline of the well installations can be modified dependent upon demand or if necessitated by contamination or loss of a well source. Alco has already drilled and test-pumped the new Bardin Well. The pump station facilities are expected to be completed and State Water Resources Control Board (SWRCB) approval is anticipated in year 2014. Approval has been obtained from SWRCB to drill the new Laurel Heights Well and construction is planned to begin in year 2014 with an anticipated completion date by the end of 2015. Approval has also been obtained for the Surrey Way Well (MB #2) and Monte Bella Boulevard Well (MB #3) and well drilling permits have already been obtained for these wells from the Monterey County Health Department (MCHD). Anticipated construction and completion dates for these wells are 2020 and 2025 respectively. Table 11 also shows the Padova Well and the Hibino Well as scheduled to be permitted by MCHD and SWRCB and drilled and brought online by 2025 and 2030 respectively. However, for all of the above wells, construction and completion dates could be moved to earlier or later dates dependent on water system demand requirements. See Tab 2 for the locations of these wells. Further, even after the addition of these new wells as listed in Table 11, Alco has ten well lots in reserve that wells could be drilled upon. Well locations are chosen by Alco on the basis of water quality and potential production capacities. Alco does not plan on obtaining any well sites in the Central Future Growth Area, as our experience and knowledge of the water quantity and quality in that area shows there to be insufficient quantity and water with a quality below State and Federal water quality standards for certain constituents.

Potential events that could cause Alco to accelerate its well construction schedule would be loss of a well due to collapse or inability to use the well due to changes in its water quality or changes in water quality standards. If any of Alco's existing water sources were to be lost, either to collapse or to potential contamination or changes in water quality standards, it would be necessary to replace the well source. Alco already has plans for construction of six new wells as shown in Table 11 and, Alco also has the benefit of already possessing ten well lots in its service area in the event that any of its existing sources ever need to be replaced for any reason.

While Alco does not forecast its water sources to become contaminated, that potential is always a consideration for any water system. Further, State and/or Federal water quality standards may be changed such that a source that is currently in compliance with all standards may be out of compliance after the implementation of any new standards. Alco deals with these issues by diversifying source locations in the service area, so that any contamination, if it were to occur, is only likely to affect a minimal number of sources and not all of the water sources at the same time. If contamination does occur, having diversified sources allows Alco to isolate the affected sources and evaluate whether:

- To discontinue use of the sources without replacing them
- To discontinue use of the sources and replace them with new sources
- To blend the sources with sources meeting the standards
- To treat the sources for the contaminant(s) found

Alco’s practice is to obtain a 20,000 square foot well lot, which is large enough to allow the utility to install blending and/or treatment facilities as is deemed necessary, depending upon the contaminant.

If treatment were to become necessary, Alco’s current customers will benefit from the additional ratepayers in the Central Future Growth Area, as costs will be able to be spread over a larger customer base.

Additionally, Alco plans to construct a 5MG water storage tank at an elevation that will adequately provide pressure to its existing system and additional capacity for the future demand. Furthermore, the storage facility will allow treatment of Alco's current standby sources by blending the water produced by these wells with water from sources that meet water quality standards. The 5MG storage tank will benefit both system reliability and system pressure.

Implementation - Financing of Water System Facilities

Alco is a public utility regulated by the California Public Utilities Commission. Facilities installed to provide service to new development are covered by a Rule 15 Main Extension Contract. This contract requires developers to pay for all the water system facility improvements necessary to provide water service to their projects. Developers are required to pay for water system engineering and construction, inspection, pipes, valves, booster pumping facilities, wells, treatment, reservoirs and all necessary appurtenances that supply water to their development. In addition, they are required to provide suitable land, easements and rights-of-way to install water system facilities including but not limited to wells, booster stations, pipelines and/or reservoirs at locations acceptable to the utility. In this manner of developer's financing of facilities, it is assured that all of their proposed projects will have the facilities to be supplied with water.

The water utility, however, does finance the water system facilities and improvements for its existing water users. In the case of the 5MG storage reservoir, it will be built and paid for by the utility.

Approvals

Once a specific plan and the EIR for the project are approved by the City, the following approvals are needed to implement the water system facilities that will affect the project. Alco's current service area, approved by the California Public Utilities Commission (CPUC), already includes a portion of the Central Area. If Alco were to provide service to the rest of the Central area, it would require approval of the CPUC to add the rest of the Central Area to Alco's service area. The following approvals are not necessarily in order of importance or timing;

- Easements and Rights-of-Way meeting utility requirements
- Land for production, storage and pumping facilities
- Utility's Engineer to perform system modeling for pipe sizing
- Monterey County Health Department, Environmental Health Division for well permit
- Monterey Bay Unified Air Pollution Control District for operation of emergency generator
- Monterey County Public Works for encroachment permit of pipelines
- City of Salinas Public Works for encroachment permit of pipelines
- State Water Resources Board for well operating permit
- State Water Resources Board for approval of wells and treatment, if required, and associated water system facilities permit amendment(s)

ALCO'S ABILITY TO MEET THE PROJECT WATER DEMAND

Per Senate Bills 610 and 221, Alco is responding to the following question in this report; "Will the water supplier's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection meet the projected water demand of the proposed project, in addition to the water supplier's existing and planned future uses, including agricultural and manufacturing uses?"

The answer is YES, the Alco system CAN provide the required and necessary water service to the proposed projects in the Central Area of the City's Specific Plans during normal years, dry years and multiple dry years in conjunction with adequately providing water service as per the requirements of Senate Bills 610 and 221 during normal, single dry and multiple dry water years.

Even if potential water contamination occurs, Alco can still adequately provide water service as a result of the utility's diversification of water source locations, its additional well locations that can be developed, and its well lots that are sized to allow for future water treatment facilities, if necessary, which can be installed if the need were to occur.

Alco has sources of proven capacity to meet current and future water demands and will add any future sources and facilities as specific projects demand and as outlined in the previous content of this report. These water system facilities will be paid for by the project developers and any other entities necessitating the water system facilities to be installed. None of the water for these proposed projects will come from water supplies never before used; all of the water will come either from our existing sources or new groundwater well sources drawing water from an aquifer already in use and of known quality and quantity.

Additionally, as stated earlier in this report, the California Public Utilities Commission (CPUC), in its Decision 09-04-035 (D.0904035) has already determined that Alco could adequately provide water service to the future growth areas and authorized Alco to do so.

SUBJECT: FUTURE GROWTH AREA WATER SUPPLY

Dear Mr. Jones and Mr. Adcock:

The Water Supply Assessments (WSA) prepared for your respective service areas employ different methodologies to project water use/demand calculations. A further study (copy attached) prepared by P&D Consultants for the Plans for Services and Facilities report required for the Sphere of Influence and Annexation applications provides yet another method of projecting water demand (using the City of Chino Hills as the source).

The California Water Service Company (Cal Water) WSA projects an average use of 355.8 gallons per day per service (dwelling unit) or 97.3 gallons per person per day factoring the City's current average household size of 3.67 persons. A subsequent survey of 64 households in a recently developed area indicated water use of 103 gallons per person per day. However, looking at the projected water demand for the West Area Specific Plan, 2,100,000 gallons per day is estimated. Dividing that number by the proposed 4,340 dwelling units results in a projected demand of 483.8 gallons per day per unit or 131.8 gallons per person per day.

The Alisal Water Service Company (ALCO) WSA projects an average use of 312 gallons per day per unit or 85 gallons per person per day. ALCO's subsequent analysis of the Central Specific Plan Area indicated a projected demand of 105.9 gallons per person per day.

Both the Cal Water and ALCO projected demand is inclusive of the associated commercial, school, and park uses anticipated in the planning areas.

P&D Consultants' report projects demand at 150 gallons per person per day plus additional demands for the associated uses. Using the projected demand for the West Area Specific Plan of 2,665,773 gallons per day divided by 4,340 dwelling units results in a projected demand of

614.23 gallons per day per unit or 167.37 gallons per day per person. This is nearly double ALCO's projection.

Water use is such a critical and controversial aspect of our planning process. As such, it is important that we are consistent in the methodologies used to project demand. The City has historically projected water use at 150 gallons per person per day as part of our environmental review process. This figure is inclusive of the associated "other' uses. City staff is comfortable using this figure with the recognition that the "other" uses in the specific plans will be relatively "dry" retail, service commercial, mixed-use, and public uses. It is noted that the federal Environmental Protection Agency projects a per person water demand of 183 gallons per person per day. However, California has imposed water conservation regulations for many years, which are not necessarily found across the country.

This issue was discussed at the last Future Growth Area planning workshop held on September 14, 2006. The direction established at that meeting was to request a commitment from the water service providers to assure water service of 150 gallons per person per day inclusive of the "other" associated uses in the specific plans. Is this possible?

City staff would be happy to meet with both Cal Water and ALCO to discuss this further if you think that it would be appropriate. Do not hesitate to contact me with any questions.

Sincerely,

ROBERT RICHELIEU

WATER SYSTEM STUDY

TABLE OF CONTENTS

Purpose

The purpose of this report is to identify the proposed water facilities necessary to develop the Salinas North Future Growth Area (North FGA) as identified in Exhibit 1. The North FGA is divided into three specific plan areas: west, central and east as shown in Exhibit 2 and comprises 2,488 acres.

Background Information

The City of Salinas, the county seat and largest city in Monterey County, is located in the northwest part of the Salinas Valley about 60 miles south of San Jose and 10 miles inland from Monterey Bay.

Study Methodology

The North FGA involves 2,488 acres which are divided into three specific plan areas. The development capacity of the North FGA specific plan areas are shown in the following three tables. The estimate of population for the specific plan area is 3.67 people per dwelling unit.

	Total	**693**	**4,340**	**1,564**

Assumptions:

Persons per Household = 3.67
1 Household = 1 Dwelling Unit
Net Acres = Gross Acres x 0.85

Footnotes:

[1] Total acreage for RLD use within the North Future Growth Area as shown on the adopted General Plan Land Use Policy Map (Figure LU-3) is 1,042 net acres, rather than 1,042 net acres, as shown in Table LU-3. The difference (18 net acres) is attributed to a late change to the Land Use Policy Map within Area 3, where 15 net acres of RLD were re-designated as PSP to accommodate a combined Junior and Senior High School complex, and 3 net acres were re-designated as Open Space.

[2] Total acreage for MIX use within the North Future Growth Area as shown on the adopted General Plan Land Use Policy Map (Figure LU-3) is 118 net acres, rather than 120 net acres, as shown in Table LU-3. The difference (2 net acres) is attributed to a late change to the Land Use Policy Map within Area 3, where 2 net acres of MIX were re-designated as OS in the vicinity of the Junior and Senior High School complex described above.

[3] Total acreage for PKS within the Specific Plan Areas will be based on the Future Park Needs section of the Conservation/Open Space Element which will need to be updated to reflect final General Plan information.

[4] Total acreage for PSP includes public schools the size of which was estimated for the North Future Growth Area. The actual net acres required for the individual school sites will be determined by the respective school district.

Design Guidelines

The City of Salinas is served by two water companies; California Water Service Company and ALCO Water Company. The current service boundary separating these water providers is the electric power line easement near Hemingway Drive. A list of water demand rates for various land uses is listed in Table 2

Table 2
Flow Generation Rates

Development Type	Units	Generation Rate (Gallons Per Day)
Person	Person	150
DU	DU	550
Retail	Acre	3000
Office	Acre	3000
Mixed Use	Acre	3000
Parks	Acre	1500
School	Acre	1500

Source: City of Chino Hills

DU = Dwelling Unit

Water lines were designed with a minimum size of 8 inches. The water lines were designed for maximum day plus fire flow. Unit costs were developed and are as follows.

Table 3
Pipe Unit Cost

Pipe Size (Inches)	Unit Cost (Per Linear Foot)
8	\$ 70
12	\$ 90
16	\$100
24	\$120

Results of the Model

West Specific Plan Area

The West Specific Plan (SP) area adds approximately 2.7 million gallons per day of water demand to the system. Water demand is listed in Table 4. The total length of water lines for this plan area is listed in Table 5.

Table 4
West Specific Plan Area

Development	Units	Generation Rates (GPD)	Quantity	Average Water Demand (GPD)	Average (GPM)
Low Density	DU	550	1,671	919,886	639

APPENDIX H – NOISE TECHNICAL REPORT

Central Area Specific Plan

City of Salinas, California

November 7, 2018

jcb Project # 2015-152

Prepared for:

DE NOVO PLANNING GROUP

Attn:
Steve McMurtry
1020 Suncast Lane, Suite 106
El Dorado Hills, California 95762

Prepared by:

j.c. brennan & associates, Inc.

Jim Brennan
President
Member, Institute of Noise Control Engineering (INCE)

This section provides a general description of the existing noise sources in the project vicinity, a discussion of the regulatory setting, and identifies potential noise impacts associated with the proposed project. Project impacts are evaluated relative to applicable noise level criteria and to the existing ambient noise environment. Mitigation measures have been identified for significant noise-related impacts. The noise analysis was completed by j.c. brennan & associates. Inc. (December 2016).

No comments related to noise were received during the public review period for the Notice of Preparation.

3.7.1 ENVIRONMENTAL SETTING

KEY TERMS

Acoustics	The science of sound.
Ambient Noise	The distinctive acoustical characteristics of a given area consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.
Attenuation	The reduction of noise.
A-Weighting	A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.
Decibel or dB	Fundamental unit of sound, defined as ten times the logarithm of the ratio of the sound pressure squared over the reference pressure squared.
CNEL	Community noise equivalent level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 to 10 p.m.) weighted by a factor of three and nighttime hours weighted by a factor of 10 prior to averaging.
Frequency	The measure of the rapidity of alterations of a periodic acoustic signal, expressed in cycles per second or Hertz.
Impulsive	Sound of short duration, usually less than one second, with an abrupt onset and rapid decay.
L_{dn}	Day/Night Average Sound Level. Like CNEL but with no evening weighting.
L_{eq}	Equivalent or energy-averaged sound level.
L_{max}	The highest root-mean-square (RMS) sound level measured over a given period.
$L_{(n)}$	The sound level exceeded a described percentile over a measurement period. For instance, an hourly L_{50} is the sound level exceeded 50 percent of the time during the one-hour period.
Loudness	A subjective term for the sensation of the magnitude of sound.
Noise	Unwanted sound.
SEL	Sound exposure levels. A rating, in decibels, of a discrete event, such as an aircraft flyover or train passby, that compresses the total sound energy into a one-second event.

FUNDAMENTALS OF ACOUSTICS

Acoustics is the science of sound. Sound may be thought of as mechanical energy of a vibrating object transmitted by pressure waves through a medium to human (or animal) ears. If the pressure variations occur frequently enough (at least 20 times per second), then they can be heard and are called sound. The number of pressure variations per second is called the frequency of sound, and is expressed as cycles per second or Hertz (Hz).

Noise is a subjective reaction to different types of sounds. Noise is typically defined as (airborne) sound that is loud, unpleasant, unexpected or undesired, and may therefore be classified as a more specific group of sounds. Perceptions of sound and noise are highly subjective from person to person.

Measuring sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale uses the hearing threshold (20 micropascals), as a point of reference, defined as 0 dB. Other sound pressures are then compared to this reference pressure, and the logarithm is taken to keep the numbers in a practical range. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB, and changes in levels (dB) correspond closely to human perception of relative loudness.

The perceived loudness of sounds is dependent upon many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable, and can be approximated by A-weighted sound levels. There is a strong correlation between A-weighted sound levels (expressed as dBA) and the way the human ear perceives sound. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment. All noise levels reported in this section are in terms of A-weighted levels, but are expressed as dB, unless otherwise noted.

The decibel scale is logarithmic, not linear. In other words, two sound levels 10 dB apart differ in acoustic energy by a factor of 10. When the standard logarithmic decibel is A-weighted, an increase of 10 dBA is generally perceived as a doubling in loudness. For example, a 70-dBA sound is half as loud as an 80-dBA sound, and twice as loud as a 60-dBA sound.

Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given environment. A common statistical tool to measure the ambient noise level is the average, or equivalent, sound level (L_{eq}), which corresponds to a steady-state A weighted sound level containing the same total energy as a time varying signal over a given period (usually one hour). The L_{eq} is the foundation of the composite noise descriptor, L_{dn}, and shows very good correlation with community response to noise.

The day/night average level (L_{dn}) is based upon the average noise level over a 24-hour day, with a +10 decibel weighing applied to noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. The nighttime penalty is based upon the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because L_{dn} represents a 24-hour average, it tends to disguise short-term variations in the noise environment. CNEL is like L_{dn}, but includes a +5-dB penalty for evening noise. Table 3.7-1 lists several examples of the noise levels associated with common situations.

TABLE 3.7-1: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	*NOISE LEVEL (DBA)*	*COMMON INDOOR ACTIVITIES*
	--110--	Rock Band
Jet Fly-over at 300 m (1,000 ft)	--100--	
Gas Lawn Mower at 1 m (3 ft)	--90--	
Diesel Truck at 15 m (50 ft), at 80 km/hr (50 mph)	--80--	Food Blender at 1 m (3 ft) Garbage Disposal at 1 m (3 ft)
Noisy Urban Area, Daytime Gas Lawn Mower, 30 m (100 ft)	--70--	Vacuum Cleaner at 3 m (10 ft)
Commercial Area Heavy Traffic at 90 m (300 ft)	--60--	Normal Speech at 1 m (3 ft)
Quiet Urban Daytime	--50--	Large Business Office Dishwasher in Next Room
Quiet Urban Nighttime	--40--	Theater, Large Conference Room (Background)
Quiet Suburban Nighttime	--30--	Library
Quiet Rural Nighttime	--20--	Bedroom at Night, Concert Hall (Background)
	--10--	Broadcast/Recording Studio
Lowest Threshold of Human Hearing	--0--	Lowest Threshold of Human Hearing

EFFECTS OF NOISE ON PEOPLE

The effects of noise on people can be placed in three categories:

- Subjective effects of annoyance, nuisance, and dissatisfaction;
- Interference with activities such as speech, sleep, and learning; and
- Physiological effects such as hearing loss or sudden startling.

Environmental noise typically produces effects in the first two categories. Workers in industrial plants can experience noise in the last category. There is no completely satisfactory way to measure the subjective effects of noise or the corresponding reactions of annoyance and dissatisfaction. A wide variation in individual thresholds of annoyance exists and different tolerances to noise tend to develop based on an individual's past experiences with noise.

Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which one has adapted: the so-called ambient noise level. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will be judged by those hearing it. The following relationships occur regarding increases in A-weighted noise level:

- Except in carefully controlled laboratory experiments, a 1 dBA change cannot be perceived;
- Outside of the laboratory, a 3-dBA change is considered a just-perceivable difference;
- A change in level of at least 5-dBA is required before any noticeable change in human response would be expected; and

- A 10-dBA change is subjectively heard as approximately a doubling in loudness, and can cause an adverse response.

Stationary point sources of noise – including stationary mobile sources such as idling vehicles – attenuate (lessen) at a rate of approximately 6 dB per doubling of distance from the source, depending on environmental conditions (i.e., atmospheric conditions and either vegetative or manufactured noise barriers, etc.). Widely distributed noises, such as a large industrial facility spread over many acres, or a street with moving vehicles, would typically attenuate at a lower rate.

EXISTING NOISE LEVELS

Surrounding Land Uses

North: Land to the north of the Specific Plan Area is currently used primarily for agricultural production with some scattered residences along Old Stage Road. Further to the north is the unincorporated community of Natividad, near the corner of the intersection of Old Natividad Road and Old Stage Road. Scattered residences and other non-residential uses are located within Natividad. These land uses are all located in the unincorporated area of Monterey County.

East: Land to the east of the Specific Plan Area is currently used primarily for agriculture. Across Boronda Road directly to the east and southeast, is the East Area Specific Plan. The portion of the East Area Specific Plan which abuts the Specific Plan Area is primarily residential. Development of the East Area Specific Plan is expected to include up to 4,000 dwelling units and 22 acres of village center/commercial uses.

South: Across Boronda Road directly to the south, is the Harden Ranch Specific Plan. The portion of the Harden Ranch Specific Plan which abuts the Plan Area is primarily residential. Additionally, two schools, Everett Alvarez High School and John Steinbeck Elementary School, are located to the south of the Specific Plan Area.

West: Across Natividad Road directly to the west, is the West Area Specific Plan. The portion of the West Area Specific Plan which abuts the Plan Area is primarily residential. Most of the residences are of the type associated with low density residential uses, mainly single-family detached homes. The area directly to the west is residential consisting of low, medium and high density residential uses. The West Area Specific Plan designates this land for Supplemental Storm Water Detention/Retention, Neighborhood Parks, Neighborhood Edge Residential (NE), Neighborhood General 1 Residential (NG-1), and Neighborhood General 2 Residential (NG-2). Also located farther to the west is Santa Rita Elementary School (Santa Rita Union School District) which is zoned Public/Semipublic (PS).

The City and County General Plan land use designations for the above areas are illustrated on Figure 2-3.

Existing Ambient Noise Levels

To quantify the existing ambient noise environment in the project vicinity, short-term and continuous (24-hour) noise level measurements were conducted in the Plan Area on January 19th and 20th, 2016. The noise measurement locations are shown on Figure 3.7-1. The noise level measurement survey results are provided in Table 3.7-2. Appendix A of **Appendix H** of this EIR shows the complete results of the noise monitoring survey.

The sound level meters were programmed to collect hourly noise level intervals at each site during the survey. The maximum value (L_{max}) represents the highest noise level measured during an interval. The average value (L_{eq}) represents the energy average of all the noise measured during an interval. The median value (L_{50}) represents the sound level exceeded 50 percent of the time during an interval.

TABLE 3.7-2: SUMMARY OF EXISTING BACKGROUND NOISE MEASUREMENT DATA

SITE	LOCATION	DATE/TIME	L_{DN}	AVERAGE MEASURED HOURLY NOISE LEVELS, DB					
				DAYTIME (7AM-10PM)			NIGHTTIME (10PM-7AM)		
				L_{EQ}	L_{50}	L_{MAX}	L_{EQ}	L_{50}	L_{MAX}
Continuous (24-hour) Noise Level Measurements									
A	75 ft. from centerline of Boranda Road	1/19/16 - 1/20/16 24-hour	69.0	66.2	64.7	79.9	61.5	51.1	76.9
Short-Term Noise Level Measurements									
1	Northwest corner of site	1/19/16 – 4:45 p.m.	N/A	55	50	61	Primary noise source is: Traffic on Natividad Road		
		1/20/16 – 8:15 a.m.	N/A	56	51	61			
		1/20/16 1:35 p.m.	N/A	56	50	62			
2	South/central portion of site	1/19/16 – 5:15 p.m.	N/A	66	64	72	Primary noise source is: Traffic on Boronda Road		
		1/20/16 – 8:40 a.m.	N/A	65	63	72			
		1/20/16 – 2:10 p.m.	N/A	65	62	72			

NOTE: N/A = NOT APPLICABLE.
SOURCE: J.C. BRENNAN & ASSOCIATES, INC., 2016.

Larson Davis Laboratories (LDL) Model 820 precision integrating sound level meters were used for the ambient noise level measurement survey. The meters were calibrated before and after use with an LDL Model CAL200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the American National Standards Institute for Type 1 sound level meters (ANSI S1.4).

EXISTING ROADWAY NOISE LEVELS

To predict existing noise levels due to traffic, the Federal Highway Administration (FHWA) Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. The model is based upon the Calveno reference noise emission factors for automobiles, medium trucks, and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site. The FHWA model was developed to predict hourly L_{eq} values for free-flowing traffic conditions.

Traffic volumes for existing conditions were obtained from the traffic data prepared for the proposed project by Fehr & Peers. Truck percentages and vehicle speeds on the local area roadways were estimated from field observations.

Traffic noise levels are predicted at the sensitive receptors located at the closest typical setback distance along each Plan Area roadway segment. Where traffic noise barriers are predominately along a roadway segment, a -5 dB offset was added to the noise prediction model to account for various noise barrier heights. A -5 dB offset was also applied where outdoor activity areas are shielded by intervening buildings. In some locations, sensitive receptors may be located at distances which vary from the assumed calculation distance and may experience shielding from intervening barriers or sound walls. However, the traffic noise analysis is believed to be representative of most sensitive receptors located closest to the Plan Area roadway segments analyzed in this section.

Table 3.7-3 shows the existing traffic noise levels in terms of L_{dn} at closest sensitive receptors along each roadway segment. A complete listing of the FHWA Model input data is contained in the appendices to this report.

3.7.2 REGULATORY SETTING

FEDERAL

There are no federal regulations related to noise that apply to the proposed project.

STATE

California Environmental Quality Act

The California Environmental Quality Act (CEQA) Guidelines, Appendix G, indicate that a significant noise impact may occur if a project exposes persons to noise or vibration levels more than local general plans or noise ordinance standards, or cause a substantial permanent or temporary increase in ambient noise levels. CEQA standards are discussed more below under the Thresholds of Significance section.

California State Building Codes

The State Building Code, Title 24, Part 2 of the State of California Code of Regulations establishes uniform minimum noise insulation performance standards to protect persons within new buildings which house people, including hotels, motels, dormitories, apartment houses and dwellings other than single-family dwellings. Title 24 mandates that interior noise levels attributable to exterior sources shall not exceed 45 dB L_{dn} or CNEL in any habitable room.

Title 24 also mandates that for structures containing noise-sensitive uses to be located where the L_{dn} or CNEL exceeds 60 dB, an acoustical analysis must be prepared to identify mechanisms for limiting exterior noise to the prescribed allowable interior levels. If the interior allowable noise levels are met by requiring that windows be kept closed, the design for the structure must also specify a ventilation or air conditioning system to provide a habitable interior environment.

Building codes are updated periodically and each individual building within the Plan Area would be subject to the Building Code in effect at that time.

City of Salinas General Plan

The City of Salinas General Plan Noise Element includes the following goals, policies, and actions regarding noise that are applicable to the proposed project:

NOISE ELEMENT

Policy N-1-1: Ensure that new development be made compatible with the noise environment by using noise/land use compatibility standards and the Noise Contours Map as a guide for future planning and development decisions.

Policy N-1-2: Require the inclusion of noise-reducing design features in development and reuse/revitalization projects to address the impact of noise on residential development.

Policy N-1-3: Locate only urban development within the Salinas Municipal Airport "area of influence" that is compatible with the airport noise environment and meets the guidelines of the Caltrans Handbook.

Policy N-1-4: Ensure proposed development meets Title 24 Noise Insulation Standards for construction.

Policy N-2-1: Ensure that noise impacts generated by vehicular sources are minimized through the use of noise control measures (i.e. earthen berms, landscaped walls, lowered streets).

Policy N-2-2: Control truck traffic routing to reduce transportation related noise impacts on sensitive uses.

Policy N-3-1: Enforce the City of Salinas Noise Ordinance to ensure stationary noise sources and noise emanating from construction activities, private developments/residents and special events are minimized.

NOISE COMPATIBILITY STANDARDS

Table N-2 (reprinted as Table 3.7-4 below) of the General Plan shows a simplified view of the maximum noise level of several land use categories. Table N-3 (reprinted as Table 3.7-5 below) gives a detailed overview of the acceptable and unacceptable community noise exposure for all the land use categories that are applied throughout the City. Several of the land use categories are of relevance to the proposed project, namely Residential, Schools, Parks, and Agriculture. However, the Residential land use category is the most sensitive and as such it will be used as the bench mark for Acceptable and Unacceptable noise levels.

TABLE 3.7-4: EXTERIOR NOISE STANDARDS

DESIGNATION/DISTRICT OF PROPERTY RECEIVING NOISE	*MAXIMUM NOISE LEVEL, L_{DN} OR CNEL, DBA*
Agricultural	70
Residential	60
Commercial	65
Industrial	70
Public and Semipublic	60

SOURCE: CITY OF SALINAS GENERAL PLAN, TABLE N-2. SEPTEMBER 2002.

TABLE 3.7-5: NOISE/LAND USE COMPATIBILITY MATRIX

	ZONE A - NORMALLY ACCEPTABLE: *Specified land use is satisfactory, based upon the assumption that any buildings involved meet conventional Title 24 construction standards. No special noise insulation requirements.*
	ZONE B - CONDITIONALLY ACCEPTABLE: *New construction or development shall be undertaken only after a detailed noise analysis is made and noise reduction measure are identified and included in the project design.*
	ZONE C - NORMALLY UNACCEPTABLE: *New construction or development is discouraged. If new construction is proposed, a detailed analysis is required, noise reduction measures must be identified, and noise insulation features included in the design.*
	ZONE D - CLEARLY UNACCEPTABLE: *New construction or development clearly should not be undertaken.*

SOURCE: CITY OF SALINAS GENERAL PLAN, TABLE N-3. SEPTEMBER 2002.

Noise levels of up to 70 dBA are considered conditionally acceptable; new development exposed to such noise levels may only be undertaken after a detailed noise analysis is conducted and noise reduction measures are included in the project design. Noise exposure levels above 70 dBA are considered unacceptable. New development in such areas will likely need substantial mitigation to meet City standards.

City of Salinas Zoning Code and Noise Ordinance

Section 37-50.180 of the Zoning Code identifies performance standards for noise. The maximum noise level for Residential Districts, the most sensitive zone in the Plan Area, is set at 60 dBA. This standard is 5.0 dBA lower between 9:00 p.m. and 7:00 a.m. It is noted that there is a slight reprieve in that noise that is produced for no more than a cumulative period of five minutes in any hour may exceed the standard by 5.0 dBA. Furthermore, interior noise level in any residential dwelling unit located in a mixed-use building or development shall not exceed a maximum of 45 dBA from exterior ambient noise. Again, there is a slight reprieve in that noise that is produced for no more than a cumulative period of one minute in any hour may exceed the standards above by 10.0 dBA.

The City's Noise Ordinance, Chapter 21A of the Municipal Code, defines the following classes of noise (A through D) and defines noise regulations that pertain to each class:

- Class A Noise is defined as noise created by equipment operated in the public interest or for emergency or safety purposes. Such equipment includes sirens, street sweepers, garbage trucks, chipper machines, etc. Class A noise is allowed at any time.

- Class B Noise is defined as noise created or generated within or adjacent to residential property which is normally associated with residential living. Class B noise includes lawn mowers, trimmers, home appliances, vehicle repairs, home construction projects, etc. Class B noise is not allowed between 9:00 p.m. and 7:00 a.m.

- Class C Noise is defined as noise made by motorized or mechanical equipment or devices used in sporting, recreational and hobby activities. Class C noise includes go-carts, mini-bikes, model planes and cars, etc. Class C noise is not allowed between 9:00 p.m. and 7:00 a.m. Class C noise must be made at such a distance away from a residential area so that residents will not be unreasonably disturbed by the noise of the equipment or devices.

- Class D Noise is defined as noise that is unnecessary, unnatural or unusual noises created by a human voice or animal outcry, or by any other means which is so annoying, or which is so harsh or prolonged, as to be injurious to the health, peace or comfort of any reasonable person residing in the area. Class D noise is not permitted at any time.

VIBRATION STANDARDS

Vibration is like noise in that it involves a source, a transmission path, and a receiver. While vibration is related to noise, it differs in that in that noise is generally considered to be pressure waves transmitted through air, whereas vibration usually consists of the excitation of a structure or surface. As with noise, vibration consists of an amplitude and frequency. A person's perception to the vibration will depend on their individual sensitivity to vibration, as well as the amplitude and frequency of the source and the response of the system which is vibrating.

Vibration can be measured in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration measures in terms of peak particle velocities in inches per second.

Standards pertaining to perception as well as damage to structures have been developed for vibration levels defined in terms of peak particle velocities.

The City of Salinas does not have specific policies pertaining to vibration levels. However, vibration levels associated with construction activities and railroad operations are addressed as potential noise impacts associated with project implementation.

Human and structural response to different vibration levels is influenced by several factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events. Table 3.7-6 indicates that the threshold for damage to structures ranges from 0.2 to 0.6 peak particle velocity in inches per second (in/sec p.p.v). One-half this minimum threshold or 0.1 in/sec p.p.v. is considered a safe criterion that would protect against architectural or structural damage. The general threshold at which human annoyance could occur is noted as 0.1 in/sec p.p.v.

TABLE 3.7-6: EFFECTS OF VIBRATION ON PEOPLE AND BUILDINGS

Peak Particle Velocity		*Human Reaction*	*Effect on Buildings*
mm/sec.	*in./sec.*		
0.15-0.30	0.006-0.019	Threshold of perception; possibility of intrusion	Vibrations unlikely to cause damage of any type
2.0	0.08	Vibrations readily perceptible	Recommended upper level of the vibration to which ruins and ancient monuments should be subjected
2.5	0.10	Level at which continuous vibrations begin to annoy people	Virtually no risk of "architectural" damage to normal buildings
5.0	0.20	Vibrations annoying to people in buildings (this agrees with the levels established for people standing on bridges and subjected to relative short periods of vibrations)	Threshold at which there is a risk of "architectural" damage to normal dwelling - houses with plastered walls and ceilings. Special types of finish such as lining of walls, flexible ceiling treatment, etc., would minimize "architectural" damage
10-15	0.4-0.6	Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges	Vibrations at a greater level than normally expected from traffic, but would cause "architectural" damage and possibly minor structural damage.

SOURCE: CALTRANS. TRANSPORTATION RELATED EARTHBORN VIBRATIONS. TAV-02-01-R9601 FEBRUARY 20, 2002.

3.7.3 IMPACTS AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

Consistent with Appendix G of the CEQA Guidelines, the project will have a significant impact related to noise if it will result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;

- A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without project;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels within two miles of a public airport or public use airport; or
- For a project within the vicinity of a private airstrip, expose people residing or working in the Project area to excessive noise levels.

The Plan Area is not located within two miles of a public or private airport or airstrip. Therefore, airplane and airport noise are not discussed further in this analysis.

Determination of a Significant Increase in Noise Levels

The noise standards applicable to the proposed project include the relevant portions of the City of Salinas General Plan, the City of Salinas Zoning Ordinance and Noise Ordinance described in the Regulatory Framework section above, and the following standards. Generally, a project may have a significant effect on the environment if it will substantially increase the ambient noise levels for adjoining areas or expose people to severe noise levels. In practice, more specific professional standards have been developed. These standards state that a noise impact may be considered significant if it would generate noise that would conflict with local project criteria or ordinances, or substantially increase noise levels at noise sensitive land uses. The potential increase in traffic noise from the proposed project is a factor in determining significance. Research into the human perception of changes in sound level indicates the following:

- A 3-dB change is barely perceptible;
- A 5-dB change is clearly perceptible; and
- A 10-dB change is perceived as being twice or half as loud.

A limitation of using a single noise level increase value to evaluate noise impacts is that it fails to account for pre-project-noise conditions. Table 3.7-7 is based upon recommendations made by the Federal Interagency Committee on Noise (FICON) to provide guidance in the assessment of changes in ambient noise levels resulting from aircraft operations. The recommendations are based upon studies that relate aircraft noise levels to the percentage of persons highly annoyed by the noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, it has been accepted that they are applicable to all sources of noise described in terms of cumulative noise exposure metrics such as the L_{dn}.

TABLE 3.7-7: SIGNIFICANCE OF CHANGES IN NOISE EXPOSURE

AMBIENT NOISE LEVEL WITHOUT PROJECT, LDN	*INCREASE REQUIRED FOR SIGNIFICANT IMPACT*
<60 dB	+5.0 dB or more
60-65 dB	+3.0 dB or more
>65 dB	+1.5 dB or more

SOURCE: FEDERAL INTERAGENCY COMMITTEE ON NOISE (FICON)

Based on the Table 3.7-7 data, an increase in the traffic noise level of 5 dB or more would be significant where the pre-project noise levels are less than 60 dB L_{dn}, or 3 dB or more where existing noise levels are between 60 to 65 dB Ldn. Extending this concept to higher noise levels, an increase in the traffic noise level of 1.5 dB or more may be significant where the pre-project traffic noise level exceeds 65 dB L_{dn}. The rationale for the Table 3.7-7 criteria is that, as ambient noise levels increase, a smaller increase in noise resulting from a project is sufficient to cause annoyance.

IMPACTS AND MITIGATION MEASURES

Impact 3.7-1: The proposed project has the potential to increase traffic noise levels at existing receptors (Significant and Unavoidable)

PROPOSED PROJECT ANALYSIS

Tables 3.7-8 through 3.7-11 show the predicted traffic noise level increases on the local roadway network for Existing No Project, Existing + Project, Existing + Project + West Area Specific Plan (WASP), Cumulative, Cumulative + Project, and Cumulative + Project + WASP conditions. The appendices provide the complete inputs and results of the FHWA traffic noise modeling.

TABLE 3.7-8: EXISTING AND EXISTING PLUS PROJECT TRAFFIC NOISE LEVELS

WHERE EXISTING NOISE LEVELS EXCEED 60 DB BUT ARE LESS THAN 65 DB, AN INCREASE OF 3 DB OR MORE WOULD BE SIGNIFICANT. WHERE EXISTING NOISE LEVELS EXCEED 65 DB, AN INCREASE OF 1.5 DB OR MORE WOULD BE SIGNIFICANT. **BOLD** TEXT INDICATES UNACCEPTABLE NOISE INCREASE.
SOURCE: J.C. BRENNAN & ASSOCIATES, INC. 2016.

As shown in Tables 3.7-8 through 3.7-11, some noise-sensitive receptors located along the Plan Area roadways are currently exposed to exterior traffic noise levels exceeding the City of Salinas 60 dB L_{dn} exterior noise level standard for residential uses. These receptors would continue to experience elevated exterior noise levels with implementation of the proposed project. For example, under Existing conditions, existing sensitive receptors located adjacent to E. Boronda Road, Constitution Boulevard, Natividad Road, and San Juan Grade Road currently experience an exterior noise levels between 61 dB and 69 dB L_{dn}. This exceeds the City's Normally Acceptable exterior noise level standard of 60 dB L_{dn}. Under Existing Plus Project conditions, exterior traffic noise levels are predicted to be approximately 68.0 dB L_{dn}. This would still exceed the City's Normally Acceptable exterior noise level standard of 60 dB L_{dn}. The proposed project's contribution ranges between 0.4 dB and 2.5 dB and in some cases would not exceed the FICON criteria (Table 3.7-7). Table 3.7-8 indicates where a significant increase in traffic levels occur, or a result of an exceedance of the City's criterion of 60 dB L_{dn}.

As shown in Table 3.7-8, the segment of Natividad Road south of E. Boronda Road would experience unacceptable noise levels under Existing Plus Project conditions. The project would cause noise levels along this segment to increase by 1.6 dB.

*****It should be noted that Russell Road, east of Natividad and Constitution Boulevard, north of Boronda Road are not currently constructed and borders the north and east portions of the project site. There are no residential uses on the north side of the new Russell Road and the east side of Constitution Bouldevard. Therefore, this analysis does not consider this to be a significant increase in noise levels. There is an analysis later in this report which evaluates the traffic noise on the new Russell Road and Constitution Boulevard, as they may affect the project site.

The following indicates where the project results in a significant traffic noise impact.

As shown in Table 3.7-8, the following roadway segments would experience unacceptable noise levels under the Existing Plus Project conditions:

- E. Boronda Road from Constitution to N. Sanborn (results in an exceedance of 60 dB L_{dn}).

As shown in Table 3.7-9, the following roadway segments would experience unacceptable noise levels under the Existing Plus Project Plus WASP conditions:

- E. Boronda Road from San Juan Grade to McKinnon (results in a 1.9 dB increase);
- E. Boronda Road from El Dorado to Natividad (results in a 3.2 dB increase);
- E. Boronda Road from Natividad to Independence (results in a 2.1 dB increase);
- E. Boronda Road from Constitution to N. Sanborn (results in an exceedance of 60 dB L_{dn});
- E. Boronda Road from N. Sanborn to Williams (results in an exceedance of 60 dB L_{dn});
- Independence Blvd, south of Boronda (results in a 3 dB increase);
- Natividad Road, south of Boronda (results in a 3.6 dB increase);
- Natividad Road from E. Boronda to Future Russell Rd (results in a 4.2 dB increase);
- Russell Road, west of San Juan Grade (results in a 3.1 dB increase).

As shown in Table 3.7-10, the following roadway segments would experience unacceptable noise levels under Cumulative Plus Project conditions:

- E. Boronda Road from Independence to Hemmingway (results in a 1.6 dB increase);
- E. Boronda Road from Hemmingway to Constitution (results in a 2.9 dB increase);
- Old Stage Road north of future Constitution (results in an exceedance of 60 dB L_{dn});
- Russell Road, west of San Juan Grade (results in a 1.6 dB increase).

As shown in Table 3.7-11, significant traffic noise increases under the Cumulative Plus Project Plus WASP traffic condition include the following:

- E. Boronda Road San Juan Grade to McKinnon – noise levels are predicted to increase by 1.7 dB from 65.4 dB to 67.1 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.

- E. Boronda Road, Natividad to Independence – noise levels are predicted to increase by 2.0 dB from 66.8 dB to 68.8 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.
- E. Boronda Road, Independence to Hemmingway – noise levels are predicted to increase by 2.1 dB from 65.5 dB to 67.6 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.
- E. Boronda Road, Hemmingway to Constitution – noise levels are predicted to increase from 57.8 dB to 60.7 dB L_{dn}. This would result in an exceedance of the City of Salinas exterior noise level standard of 60 dB L_{dn}.
- N. Sanborn Road, south of E. Boronda – noise levels are predicted to increase from 59.1 dB to 60.7 dB L_{dn}. This would result in an exceedance of the City of Salinas exterior noise level standard of 60 dB L_{dn}.
- Natividad Road, E. Boronda to Future Russell Road – noise levels are predicted to increase by 3.4 dB from 64.4 dB to 67.8 dB L_{dn}. This would exceed the FICON criteria of +3 dB where no project noise levels are between 60 to 65 dB, as outlined in Table 3.7-7.
- Old Stage Road, north of Future Constitution Road – noise levels are predicted to increase from 59.1 dB to 61.4 dB L_{dn}. This would exceed the City of Salinas exterior noise level standard of 60 dB L_{dn}. This is part of the WASP area where future noise-sensitive uses would be located.
- Old Stage Road, Future Constitution Road to Williams – noise levels are predicted to increase from 58.7 dB to 60.2 dB L_{dn}. This would exceed the City of Salinas exterior noise level standard of 60 dB L_{dn}.
- Russell Road, West of San Juan Grade – noise levels are predicted to increase by 2.3 dB from 65.5 dB to 67.8 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.

CONCLUSION

The proposed project would cause increased noise levels exceeding the City of Salinas 60 dB L_{dn} exterior noise level standard at existing residential receptors. Therefore, this would be a **potentially significant** impact. Additionally, traffic noise level increases would exceed the FICON CEQA substantial increase criteria of 1.5 to 5 dB, as outlined in Table 3.7-7. Therefore, this would be a **potentially significant** impact.

The Specific Plan Area was assumed for urban development as part of the City's General Plan and General Plan EIR. As such development of Specific Plan Area for urban uses was analyzed in the City's General Plan EIR. Build-out of the City's General Plan land use map, including the Specific Plan Area, will inherently result in an increase in traffic-related noise levels. The City of Salinas certified the Final Environmental Impact Report, Salinas General Plan (Cotton Bridges Associates 2002), adopted a statement of overriding considerations relative to this significant and unavoidable impact, and approved the Salinas General Plan.

Increasing the height of existing sound walls could be a potential mitigation measure in some locations; however, in some locations it may prove to not be practical or feasible for a variety of reasons. The footings for the walls would need to be reengineered and resized, which may result in encroachment into private property. Such encroachment would require private property owners to allow permission to enter their property. There is a possibility that private property owners have pools or other structures proximate to the existing walls that could inhibit the reconstruction of the sound wall. Also, the height of a sounds wall could result in aesthetic impacts that are unwanted in the community.

The use of quieter pavement technologies could be a potential mitigation measure. Research shows that a minimum of 3 dBA can be achieved by using alternative pavements, such as rubberized asphalt or open gap materials. Costs for these pavement technologies vary, but they have been proven to be comparable to traditional pavements. The alternative pavement would wear down as trucks and automobiles travel over these roadway segments, decreasing its noise reduction effectiveness and increasing its replacement cost. As such, rubberized asphalt is not highly desirable in most communities in California and may prove to be infeasible and not practicable in the long term. Therefore, even with implementation of the following mitigation, this would be a ***significant and unavoidable*** impact.

MITIGATION MEASURES

Mitigation Measure 3.7-1: *The project applicant shall utilize alternative pavements with noise reducing properties to repave roadway segments which result in significant increases in traffic noise. These repaving projects shall only occur where existing residential uses are adjacent to the roadways, when they are located inside of the 60 dB L_{dn} contours shown in Tables 3.7-8 through 3.7-11, or when they exceed the FICON criteria. Sixty dB L_{dn} is considered an acceptable exterior noise level standard. The use of alternative pavements is subject to the design and construction approval by the City of Salinas.*

> *<u>Under the Existing and Existing Plus Project</u> scenario (Table 3.7-8), the following roadway segment would experience a significant increase in traffic noise levels:*
>
> - *E. Boronda Road from Constitution to North of Sanborn.*
>
> *The project applicant would be required to fund the entire share of this improvement, unless the improvements are already or will already be covered by a larger and/or citywide funding program.)*
>
> *<u>Under the Existing and Existing Plus Project Plus WASP</u> scenario (Table 3.7-9), the following roadway segments would experience a significant increase in traffic noise levels or would result in an exceedance of the 60 dB L_{dn} standard:*
>
> - E. Boronda Road from San Juan Grade to McKinnon (results in a 1.9 dB increase);
> - E. Boronda Road from El Dorado to Natividad (results in a 3.2 dB increase);
> - E. Boronda Road from Natividad to Independence (results in a 2.1 dB increase);
> - E. Boronda Road from Constitution to N. Sanborn (results in an exceedance of 60 dB L_{dn});

- E. Boronda Road from N. Sanborn to Williams (results in an exceedance of 60 dB L_{dn});
- Independence Blvd, south of Boronda (results in a 3 dB increase);
- Natividad Road, south of Boronda (results in a 3.6 dB increase);
- Natividad Road from E. Boronda to Future Russell Rd (results in a 4.2 dB increase);
- Russell Road, west of San Juan Grade (results in a 3.1 dB increase).

The project applicant would be required to fund the project's proportionate fair share of this improvement.)

<u>Under the Cumulative and Cumulative Plus Project</u> scenario (Table 3.7-10), the following roadway segments would experience a significant increase in traffic noise levels or result in an exceedance of the 60 dB L_{dn} standard:

- E. Boronda Road from Independence to Hemmingway (results in a 1.6 dB increase);
- E. Boronda Road from Hemmingway to Constitution (results in a 2.9 dB increase);
- Old Stage Road north of future Constitution (results in an exceedance of 60 dB L_{dn});
- Russell Road, west of San Juan Grade (results in a 1.6 dB increase).

The project applicant would be required to fund the project's proportionate fair share of these improvements.

<u>Under the Cumulative and Cumulative Plus Project Plus WASP</u> scenario (Table 3.7-11), the following roadways experience a significant increase in traffic noise levels or result in an exceedance of the 60 dB L_{dn} standard:

- E. Boronda Road San Juan Grade to McKinnon – noise levels are predicted to increase by 1.7 dB from 65.4 dB to 67.1 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.
- E. Boronda Road, Natividad to Independence – noise levels are predicted to increase by 2.0 dB from 66.8 dB to 68.8 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.
- E. Boronda Road, Independence to Hemmingway – noise levels are predicted to increase by 2.1 dB from 65.5 dB to 67.6 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.
- E. Boronda Road, Hemmingway to Constitution – noise levels are predicted to increase from 57.8 dB to 60.7 dB L_{dn}. This would result in an exceedance of the City of Salinas exterior noise level standard of 60 dB L_{dn}.

- N. Sanborn Road, south of E. Boronda – noise levels are predicted to increase from 59.1 dB to 60.7 dB L_{dn}. This would result in an exceedance of the City of Salinas exterior noise level standard of 60 dB L_{dn}.
- Natividad Road, E. Boronda to Future Russell Road – noise levels are predicted to increase by 3.4 dB from 64.4 dB to 67.8 dB L_{dn}. This would exceed the FICON criteria of +3 dB where no project noise levels are between 60 to 65 dB, as outlined in Table 3.7-7.
- Old Stage Road, north of Future Constitution Road – noise levels are predicted to increase from 59.1 dB to 61.4 dB L_{dn}. This would exceed the City of Salinas exterior noise level standard of 60 dB L_{dn}. This is part of the WASP area where future noise-sensitive uses would be located.
- Old Stage Road, Future Constitution Road to Williams – noise levels are predicted to increase from 58.7 dB to 60.2 dB L_{dn}. This would exceed the City of Salinas exterior noise level standard of 60 dB L_{dn}.
- Russell Road, West of San Juan Grade – noise levels are predicted to increase by 2.3 dB from 65.5 dB to 67.8 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.

The project applicant would be required to fund the project's proportionate fair share of these improvements.

Impact 3.7-2: The proposed project has the potential to increase noise levels associated with construction activities (Less than Significant with Mitigation)

During the construction of the project, including roads, water, and sewer lines, and related infrastructure, noise from construction activities would add to the noise environment in the project vicinity. Existing sensitive receptors are located in the nearby residences, some of which are as close as 50 feet from the proposed construction activities. As indicated in Table 3.7-12, activities involved in construction would generate maximum noise levels ranging from 76 to 90 dB at 50 feet. Construction activities would be temporary in nature and are anticipated to occur during normal daytime working hours which are the least sensitive hours. Additionally, the majority of construction activities would occur at distances of 300 to 500 feet from the nearest residences. At these further distances, the maximum noise levels due to construction at the interior of the site would range from 60 to 70 dBA.

TABLE 3.7-12: CONSTRUCTION EQUIPMENT NOISE

TYPE OF EQUIPMENT	*MAXIMUM LEVEL, DB AT 50 FEET*
Backhoe	78
Compactor	83
Compressor (air)	78
Concrete Saw	90

Dozer	82
Dump Truck	76
Excavator	81
Generator	81
Jackhammer	89
Pneumatic Tools	85

SOURCE: ROADWAY CONSTRUCTION NOISE MODEL USER'S GUIDE. FEDERAL HIGHWAY ADMINISTRATION. FHWA-HEP-05-054. JANUARY 2006.

Noise would also be generated during the construction phase by increased truck traffic on area roadways. A significant project-generated noise source would be truck traffic associated with transport of heavy materials and equipment to and from construction sites. This noise increase would be of short duration and would likely occur primarily during daytime hours.

Construction activities would be temporary in nature and are exempt from noise regulation during the hours of 7:00 a.m. to 9:00 p.m., as outlined in the City's Municipal Code for Type B noise. Additionally, the project site was assumed for urban development as part of the City's General Plan and General Plan EIR. Build-out of the City's General Plan land use map, including the proposed project site, will inherently result in construction and construction-related noise levels. Implementation of the following mitigation measures will ensure that these potential impacts are reduced to a ***less than significant*** level.

MITIGATION MEASURES

Mitigation Measure 3.7-2: *Construction activities shall adhere to the requirements of the City of Salinas Municipal Code with respect to hours of operation. This requirement shall be noted in the improvement plans prior to approval by the City's Building Department.*

Mitigation Measure 3.7-3: *All equipment shall be fitted with factory equipped mufflers and in good working order. This requirement shall be noted in the improvement plans prior to approval by the City's Building Department. All stationary noise generating equipment (i.e. generators) shall be located at least 300 feet from a sensitive receptor. All construction staging areas shall be located at least 300 feet from a sensitive receptor.*

Impact 3.7-3: The proposed project has the potential to increase noise vibration association with construction activities (Less than Significant)

The primary vibration-generating activities associated with the proposed project would happen during construction when activities such as grading, utilities placement, and road construction occur. Sensitive receptors which could be impacted by construction-related vibrations, especially vibratory compactors/rollers, are located approximately 100 feet or further from the Plan Area. At this distance, construction vibrations are not predicted to exceed acceptable levels. Additionally, construction activities would be temporary in nature and would likely occur during normal daytime working hours.

Construction vibration impacts include human annoyance and building structural damage. Human annoyance occurs when construction vibration rises significantly above the threshold of perception. Building damage can take the form of cosmetic or structural. Table 3.7-13 shows the typical vibration levels produced by construction equipment.

TABLE 3.7-13: VIBRATION LEVELS FOR VARYING CONSTRUCTION EQUIPMENT

TYPE OF EQUIPMENT	*PEAK PARTICLE VELOCITY @ 25 FEET (INCHES/SECOND)*	*PEAK PARTICLE VELOCITY @ 100 FEET (INCHES/SECOND)*
Large Bulldozer	0.089	0.011
Loaded Trucks	0.076	0.010
Small Bulldozer	0.003	0.000
Auger/drill Rigs	0.089	0.011
Jackhammer	0.035	0.004
Vibratory Hammer	0.070	0.009
Vibratory Compactor/roller	0.210	0.026

SOURCE: FEDERAL TRANSIT ADMINISTRATION, TRANSIT NOISE AND VIBRATION IMPACT ASSESSMENT GUIDELINES, MAY 2006

Table 3.7-13 data indicate that construction vibration levels anticipated for the proposed project are less than the 0.1 in/sec criteria at distances of 50 feet. Therefore, construction vibrations are not predicted to cause damage to existing buildings or cause annoyance to sensitive receptors. Implementation of the proposed project would have a ***less than significant*** impact relative to this environmental topic.

Impact 3.7-4: The proposed project has the potential to expose new sensitive receptors to excessive transportation noise (Less than Significant with Mitigation)

EXTERIOR NOISE IMPACTS

The FHWA traffic noise prediction model was used to predict Cumulative + Project + WASP traffic noise levels at the proposed residential land uses associated with the proposed project. Table 3.7-14 shows the predicted traffic noise levels at the proposed residential uses adjacent to the major Plan Area arterial roadways. Table 3.7-14 also indicates the property line noise barrier heights required to achieve compliance with an exterior noise level standard of 60 dB L_{dn}.

The complete inputs and results to the FHWA traffic noise prediction model and barrier calculations are contained in Appendix C of the Noise Study. The modeled noise barriers assume flat site conditions where roadway elevations, base of wall elevations, and building pad elevations are approximately equivalent.

To describe future noise levels due to traffic, FHWA Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. Direct inputs to the model included traffic volumes provided by Fehr & Peers. The FHWA model is based upon the Calveno reference noise factors for automobiles, medium trucks and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site. The FHWA model was developed to predict hourly L_{eq} values for free-flowing traffic conditions. To predict L_{dn}/CNEL values, it is necessary to determine the day/night distribution of traffic and adjust the traffic volume input data to yield an equivalent hourly traffic volume.

TABLE 3.7-14: CUMULATIVE + PROJECT TRANSPORTATION NOISE LEVELS AT PROPOSED RESIDENTIAL USES

ROADWAY	APPROXIMATE RESIDENTIAL SETBACK, FEET[1]	ADT	PREDICTED TRAFFIC NOISE LEVELS, DB L_{DN}[2]					
			NO WALL	6' WALL	7' WALL	8' WALL	9' WALL	10' WALL
Russell Road W. of Old Stage Road	75-feet	7,640	64	57	56	55	54	53

Boronda - Natividad to Hemmingway	75-feet	41,660	69	65	64	63	62	61
Boronda - Natividad to Constitution	75-feet	11,980	61	59	58	57	56	55
Constitution - Boronda to Old Stage	75-feet	28,240	69	63	62	60	59	59

NOTES: ADT = AVERAGE DAILY TRIPS

[1] SETBACK DISTANCES ARE MEASURED IN FEET FROM THE CENTERLINES OF THE ROADWAYS TO THE CENTER OF RESIDENTIAL BACKYARDS.

[2] THE MODELED NOISE BARRIERS ASSUME FLAT SITE CONDITIONS WHERE ROADWAY ELEVATIONS, BASE OF WALL ELEVATIONS, AND BUILDING PAD ELEVATIONS ARE APPROXIMATELY EQUIVALENT. SOUND WALL HEIGHT MAY BE ACHIEVE D THROUGH THE USE A WALL AND EARTHEN BERM TO ACHIEVE THE TOTAL HEIGHT (I.E. 6-FOOT WALL ON 2-FOOT BERM IS EQUIVALENT TO AN 8-FOOT TALL WALL).

SOURCE: FHWA-RD-77-108 WITH INPUTS FROM FEHR & PEERS, AND J.C. BRENNAN & ASSOCIATES, INC. 2016.

Table 3.7-14 data indicate that noise barriers 6- to 8-feet in height would generally be sufficient to achieve compliance with the City of Salinas 60 dB L_{dn} exterior noise level standard for the proposed residential uses. However, for the residential uses located along E. Boronda Road, sound walls of 6- to 8-feet in height would only reduce exterior noise levels to 63 dB L_{dn}. While these noise level do not meet the City's preferred 60 dB L_{dn} noise standards, they would comply with the City's conditionally acceptable standard of 60 to 70 dB L_{dn}. Final wall heights should be determined at the discretion of the City. With implementation of the following exterior noise mitigation measures, the proposed project would have a ***less than significant*** impact relative to this environmental topic.

MITIGATION MEASURES

Mitigation Measure 3.7-4: *Six- to eight-foot tall sound walls and/or landscaped berm combinations shall be constructed along the primary Plan Area roadways, adjacent to proposed residential uses, in order to achieve the City's exterior noise standards. At the City's discretion, wall heights which achieve the City's conditionally acceptable 60-70 dB L_{dn} noise standard may be allowed. See the Draft EIR Table 3.7-14 for specific noise barrier heights along each roadway. Noise barrier walls shall be constructed of concrete panels, concrete masonry units, stucco or manufactured materials (with a density of four pounds per square foot or greater), earthen landscaped berms, or any combination of these materials as determined appropriate by the City of*

Salinas. The design/appearance of the wall is subject to the design approval by the City of Salinas to ensure that it is visually pleasing. Wood is not recommended due to eventual warping and degradation of acoustical performance. The walls shall not have gaps or penetrations which allow sound to flank through or around the walls. Small gaps which may occur using materials such as "keystone" blocks shall be avoided. Additionally, in accordance with Section 5-03.19 of the City's Municipal Code, best management practices shall be incorporated into the sound wall design in order to control graffiti and/or mitigate the potential impacts of graffiti. These graffiti prevention best management practices may include, without limitation:

(1) The use or the installation and maintenance of ant-graffiti materials approved by the city on likely graffiti-attracting surfaces.

(2) Installation and maintenance of landscaping to discourage defacement of and/or protect likely graffiti-attracting surfaces.

(3) Installation and maintenance of lighting to protect likely graffiti-attracting surfaces.

(4) Immediate removal of graffiti by appropriate means within seventy-two hours.

(5) Incorporation of architectural or design elements or features to discourage graffiti defacement in accordance with the principles of Crime Prevention Through Environmental Design (CPTED).

(6) Authorizing right of access by city employees or contract agents to remove graffiti if not removed within specified time periods.

(7) Supplying the city at its request with paint (of the appropriate color and type), cleaning agents, and/or other materials acceptable to the city to abate or to deter graffiti.

(8) Other requirements, as deemed reasonably feasible by the city planner, to deter, to protect or to reduce the potential for graffiti defacement.

These requirements shall be included in the improvement plans prior to their approval by the City's Building Department.

INTERIOR NOISE IMPACTS

Modern construction typically provides a 25-dB exterior-to-interior noise level reduction with windows closed. Therefore, sensitive receptors exposed to exterior noise of 70 dB L_{dn}, or less, will typically comply with the City of Salinas 45 dB L_{dn} interior noise level standard. Additional noise reduction measures, such as acoustically-rated windows, are generally required for exterior noise levels exceeding 70 dB L_{dn}.

It should be noted that exterior noise levels are typically 2 to 3 dB higher at second floor locations. Additionally, noise barriers do not reduce exterior noise levels at second floor locations. The proposed residential uses are predicted to be exposed to unmitigated first floor exterior transportation noise levels ranging between 63 to 71 dB L_{dn}. Therefore, second floor facades are predicted to be exposed to exterior noise levels of up to 65 to 73 dB L_{dn}.

Based upon a 25-dB exterior-to-interior noise level reduction, interior noise levels are predicted to range between 38 dB to 46 dB L_{dn} at first floor residences, and between 40 dB and 48 dB L_{dn}, at second floor residences. Predicted interior noise levels could exceed the City's 45 dB L_{dn} interior noise level standard at the first row of residential uses located closest to Boronda Road and Constitution Boulevad. Therefore, additional interior noise control measures would be required for these residential uses. To reduce interior noise levels to 45 dB L_{dn}, or less, it is likely that second floor facades would require windows having a Sound Transmission Class (STC) 35 rating, or higher. Exterior walls would also likely require 3-coat stucco and RC-channels. This would specifically apply to the first row of homes along E. Boronda Road and Natividad Road and would not apply to facades facing away from the roadway.

This analysis assumes that mechanical ventilation will be provided to allow residents to keep doors and windows closed, as desired for acoustical isolation. With implementation of the following interior noise mitigation measures, the proposed project would have a ***less than significant*** impact relative to this environmental topic.

MITIGATION MEASURES

Mitigation Measure 3.7-5: *The first row of residential uses located along E. Boronda Road and Constitution Boulevard shall include windows having a Sound Transmission Class (STC) 35, or higher, rating installed in second floor facades. Exterior walls shall also require 3-coat stucco and RC-channels. The exterior wall specifications would specifically apply to the first row of homes and does not apply to facades facing away from the roadway. A detailed analysis of any additional interior mitigation measures shall be conducted when building plans are available to verify these requirements. These requirements shall be included in the improvement plans prior to approval by the City's Building Department.*

Mitigation Measure 3.7-6: *Mechanical ventilation shall be installed in all residential uses sufficient to allow residents, as desired for acoustical isolation, to keep their doors and windows closed and still maintain acceptable interior temperature and noise levels. This requirement shall be included in the improvement plans prior to approval by the City's Building Department.*

Impact 3.7-5: The proposed project has the potential to expose sensitive receptors to substantial noise from proposed park and school uses (Less than Significant with Mitigation)

Children playing at neighborhood parks or outdoor recreational fields (softball, soccer, basketball, tennis) are often considered potentially significant noise sources which could adversely affect adjacent noise-sensitive land uses. Typical noise levels associated with groups of approximately 50 children playing at 50 feet generally range from 55 to 60 dB L_{eq} and 70 to 75 dB L_{max}. It is expected that park activities would occur during daytime hours. Therefore, noise levels from the playgrounds would need to comply with the City of Salinas exterior noise level standards of 60 dB L_{eq} and 70 dB L_{max} at the nearest residential uses.

Based upon the reference noise level data discussed above, the 60 dB L_{eq} noise contour would be located approximately 50 feet from the center of playgrounds or recreational fields. The 70 dB L_{max} noise contour would extend approximately 90 feet from the center of playground or recreational fields. For residential backyards located less than 90 feet from the center of a playground or recreational field, noise levels may exceed the City of Salinas 70 dB L_{max} exterior noise level standard. In this case, construction of a 6-foot tall masonry sound wall would provide an approximate noise level reduction of 5 dB and would typically reduce noise levels to 60 dB L_{eq} and 70 dB L_{max}, or less.

With implementation of the following exterior mitigation measure, the proposed project would have a ***less than significant*** impact relative to this environmental topic.

MITIGATION MEASURES

Mitigation Measure 3.7-7: *When parks or play areas are located near residential uses, the center of active play areas, such as football fields, soccer fields or other athletic fields, shall be located at a minimum distance of 90-feet from the nearest residential property lines. Large active play areas shall comply with the 60 dB L_{eq} and 70 dB L_{max} standards, and shall include these further noise level evaluations during the design phases of future park areas.*

Parks shall be designed such that residences front to the park. Minimum 6-foot tall sound walls and/or landscaped berms shall be constructed where school site abuts a residential property line in instances where site design (i.e., minimum distances, siting of activity areas, etc.) cannot achieve the 60 dB L_{eq} and 70 dB L_{max} noise standards. No wall shall be required where residential uses are fronted towards a park or school site and separated by a roadway or a walkway.

Noise barrier walls shall be constructed of concrete panels, concrete masonry units, stucco or manufactured materials (with a density of four pounds per square foot or greater), earthen landscaped berms, or any combination of these materials as determined appropriate by the City of Salinas. The design/appearance of the wall is subject to the design approval by the City of Salinas to ensure that it is visually pleasing. Wood is not recommended due to eventual warping and degradation of acoustical performance. The walls shall not have gaps or penetrations which allow sound to flank through or around the walls. Small gaps which may occur using materials such as "keystone" blocks shall be avoided. This requirement shall be included in the improvement plans prior to approval by the City's Building Department.

Impact 3.7-6: The proposed project has the potential to expose sensitive receptors to substantial noise from proposed commercial mixed-uses (Less than Significant with Mitigation)

COMMERCIAL AND OFFICE LAND USES

Commercial and office land use activities can produce noise levels which affect adjacent sensitive land uses. These noise sources can be continuous and may contain tonal components which may be annoying to individuals who live in the vicinity. In addition, noise generation from fixed noise sources may vary based upon climatic conditions, time of day, and existing ambient noise levels. The primary noise sources generally include truck deliveries, trash pickup, parking lot use, and heating, ventilation, and air conditioning (HVAC) equipment operation. These sources may result in noise levels more than the City's standards at nearby receptors.

MECHANICAL EQUIPMENT

HVAC equipment can be a primary noise source associated with commercial mixed uses. These types of equipment are often mounted on roof tops, located on the ground, or located within mechanical rooms. The noise sources can take the form of fans, pumps, air compressors, chillers, or cooling towers. Noise levels from these types of equipment can vary significantly. Noise levels from these types of sources generally range between 45 dB to 70 dB at 50 feet and could exceed City standards at nearby receptors.

MEASURES TO REDUCE NOISE EXPOSURE FROM COMMERCIAL MIXED USES

Use of Setbacks: Noise exposure may be reduced by increasing the distance between the noise source and the noise-receiving use. Setbacks can take the form of open space, frontage roads, recreational areas, etc. The available noise attenuation from this technique is limited by the characteristics of the noise source, but is generally 3 to 6 dB per doubling of distance from the source. The rule-of-thumb is that most traffic and railroad noise levels will decrease or increase by approximately 4.5 dB per doubling, or halving of distance, respectively. Noise from point sources, such as HVAC equipment, will generally attenuate at 6 dB per doubling of distance.

Use of Barriers: Noise reduction can be accomplished by placing walls, berms or other structures, such as buildings, between the noise source and the receiver. In addition, intervening topography can be an effective barrier for noise control. The effectiveness of a barrier depends upon blocking line-of-sight between the source and receiver, and is improved with increases in distance the sound must travel to pass over the barrier as compared to a straight line from source to receiver. The difference between the distance over a barrier and a straight line between source and receiver is called the "path length difference," and is the basis for calculating barrier noise reduction.

In general, barriers are most effective when placed close to either the receiver or the source. An intermediate barrier location yields a smaller path length difference for a given increase in barrier height than does a location closer to either source or receiver.

Site Design, Building Locations, and Building Orientations: Buildings can be placed on a project site to shield other structures or areas, to remove them from noise-impacted areas, and to prevent an increase in noise levels caused by reflections. As an example, carports or garages can be used to form or complement a barrier, or shield an outdoor activity area. Placement of outdoor activity areas on the opposite side of the building facades from the noise source, or within the shielded portion of a building complex, such as a central courtyard, can also be an effective method of providing a quiet retreat in an otherwise noisy environment.

CONCLUSION

With implementation of the following exterior mitigation measure, the proposed project would have a ***less than significant*** impact relative to this environmental topic.

MITIGATION MEASURES

Mitigation Measure 3.7-8: *Where commercial, business professional, office, or similar uses abut residential uses or where loading docks or truck circulation routes face residential areas, the following measures shall be included in the project design:*

- *All HVAC equipment shall be located within mechanical rooms where possible or shielded from view with solid or grated barriers;*
- *Emergency generators shall comply with the City's noise criteria at the nearest noise-sensitive receivers;*
- *Delivery/loading activities shall comply with the City of Salinas Zoning Ordinance standards; and*
- *The applicant shall submit a noise study to verify that the appropriate noise control measures have been incorporated into the project design and will achieve compliance with the City's noise level standards.*

These requirements shall be included in the improvement plans prior to their approval by the City's Building Department.

Impact 3.7-7: The proposed project has the potential to expose sensitive receptors to substantial noise from proposed well sites (Less than Significant with Mitigation)

Typical noise levels for well sites at 50 feet are expected to be 60 dB L_{eq}. If a backup generator is present and running, a noise level of 70 dB L_{eq} at 50 feet would be expected. It is expected that wells could operate during daytime or nighttime hours. Long-term operation of the backup generator would only occur under emergency conditions and would therefore not be subject to the City of Salinas exterior noise level standards for Class A noise. However, weekly exercising of the generator may be subject to the City's 60 dB L_{eq} daytime exterior noise level standard at the nearest noise-sensitive residential receptors.

The specific design features of the well sites are not currently known and the associated noise levels cannot be precisely determined at the nearest proposed residential units. Therefore, the well sites should be limited to generating a noise level not exceeding the City's nighttime noise standard of 55 dB L_{eq} at the nearest on-site residential property lines under normal operations. Generators should not exceed the City's daytime noise standard of 60 dB L_{eq}. This will ensure compliance with the City's noise ordinance standards at both on-site and off-site receptors. With implementation of the following exterior mitigation measure, the proposed project would have a ***less than significant*** impact relative to this environmental topic.

MITIGATION MEASURES

Mitigation Measure 3.7-9: *The well sites shall be designed and built to not exceed a noise level of 55 dB L_{eq} at the nearest residential property line during normal operation of the stations. Generators shall not exceed the City's daytime noise standard of 60 dB L_{eq}. Generators shall be tested only during daytime hours. This requirement shall be included in the improvement plans prior to approval by the City's Building Department.*

Impact 3.7-8: Cumulative exposure of existing and future noise-sensitive land uses to increased noise resulting from cumulative development (Cumulatively Considerable and Significant and Unavoidable)

The cumulative context for a cumulative analysis can be defined by region, by political subdivision or by the geography. The cumulative setting for noise includes the study roadway segments as identified in the traffic analysis in this EIR. This area was chosen because it represents the area that is reasonably expected to be affected by changes to the ambient noise levels as the project buildouts out. Tables 3.7-10 and 3.7-11 previously shown above provide the predicted traffic noise level increases on the local roadway network for Cumulative, Cumulative + Project, and Cumulative + Project + WASP conditions. The appendices to this report provide the complete inputs and results of the FHWA traffic noise modeling.

As shown in Tables 3.7-10 and 3.7-11, some noise-sensitive receptors located along the Plan Area roadways are currently exposed to exterior traffic noise levels exceeding the City of Salinas 60 dB L_{dn} exterior noise level standard for residential uses. These receptors would continue to experience elevated exterior noise levels with implementation of the proposed project.

In some locations, the proposed project is predicted to cause increases in traffic noise levels which would trigger a new exceedance of the City of Salinas' 60 dB L_{dn} exterior noise level standard at sensitive receptor locations, or exceed the FICON allowable increase criteria outlined in Table 3.7-7. The greatest number of significant traffic noise increases would occur under the Cumulative Plus Project Plus WASP traffic condition.

Significant traffic noise increases under the Cumulative Plus Project Plus WASP traffic condition include the following:

- E. Boronda Road San Juan Grade to McKinnon – noise levels are predicted to increase by 1.7 dB from 65.4 dB to 67.1 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.
- E. Boronda Road, Natividad to Independence – noise levels are predicted to increase by 2.0 dB from 66.8 dB to 68.8 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.
- E. Boronda Road, Independence to Hemmingway – noise levels are predicted to increase by 2.1 dB from 65.5 dB to 67.6 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.
- E. Boronda Road, Hemmingway to Constitution – noise levels are predicted to increase from 57.8 dB to 60.7 dB L_{dn}. This would result in an exceedance of the City of Salinas exterior noise level standard of 60 dB L_{dn}.
- N. Sanborn Road, south of E. Boronda – noise levels are predicted to increase from 59.1 dB to 60.7 dB L_{dn}. This would result in an exceedance of the City of Salinas exterior noise level standard of 60 dB L_{dn}.
- Natividad Road, E. Boronda to Future Russell Road – noise levels are predicted to increase by 3.4 dB from 64.4 dB to 67.8 dB L_{dn}. This would exceed the FICON criteria of +3 dB where no project noise levels are between 60 to 65 dB, as outlined in Table 3.7-7.
- Old Stage Road, north of Future Constitution Road – noise levels are predicted to increase from 59.1 dB to 61.4 dB L_{dn}. This would exceed the City of Salinas exterior noise level standard of 60 dB L_{dn}. This is part of the WASP area where future noise-sensitive uses would be located.
- Old Stage Road, Future Constitution Road to Williams – noise levels are predicted to increase from 58.7 dB to 60.2 dB L_{dn}. This would exceed the City of Salinas exterior noise level standard of 60 dB L_{dn}.
- Russell Road, West of San Juan Grade – noise levels are predicted to increase by 2.3 dB from 65.5 dB to 67.8 dB L_{dn}. This would exceed the FICON criteria of +1.5 dB where no project noise levels are greater than 65 dB, as outlined in Table 3.7-7.

The proposed project would cause increased noise levels exceeding the City of Salinas 60 dB L_{dn} exterior noise level standard at existing residential receptors. Therefore, there would be a cumulative exposure of existing and future noise-sensitive land uses to increased noise resulting from cumulative development.

The proposed project, when considered alongside all past, present, and probable future projects (inclusive of buildout of the General Plan), would result in a significant cumulative impact related to traffic noise. The proposed project's incremental contribution toward this significant cumulative impact would be cumulatively considerable due to the large amount of vehicle trips that would be generated at buildout of the Plan Area.

It is noted that the City's General Plan and General Plan EIR assumes development of the Plan Area for urban uses as part of the FGA buildout. As buildout occurs it will inherently result in an increase in traffic-related noise levels. The City of Salinas certified the Final Environmental Impact Report, Salinas General Plan (Cotton Bridges Associates 2002), adopted a statement of overriding considerations relative to this significant and unavoidable impact, and approved the Salinas General Plan.

Implementation of the Central Area Specific Plan would have a ***significant cumulative impact*** and a ***cumulatively considerable contribution*** to noise.

List of Figures

List of Tables

1.0 EXECUTIVE SUMMARY

This report presents the results of the transportation impact analysis (TIA) for the Draft Central Area Specific Plan Environmental Impact Report (EIR). The Specific Plan proposes mixed use residential and commercial development that encompasses 760 acres in the northern area of the City of Salinas. Within that area the Specific Plan proposes the development of approximately 3,980 housing units, 372,000 square feet of mixed-use village center with residential and commercial development, 50 acres of parks, two elementary schools and a middle school.

Pursuant to regulations in the California Environmental Quality Act (CEQA), the purpose of this TIA is to determine whether and to what extent the Specific Plan would have significant impacts on the transportation network in the City of Salinas - including public transportation service and active transportation facilities. A performance baseline was established through traffic volume data collection and field observations of 56 study intersections in Salinas and nearby areas of unincorporated Monterey County. Freeway mainline and ramp junction volumes along US 101 were also collected. A level of service analysis (LOS) was then conducted using the observed volumes and compared against standards of significance derived from relevant local and state policy documents. An existing conditions operational analysis of the study intersections, US 101 segments, and US 101 ramp junctions found that four intersections function at LOS scores below Salinas minimum thresholds. All of the US 101 mainline sections and ramp junctions evaluated function within the standards set by the Monterey County Congestion Management Plan (CMP).

Project trip generation – the amount of traffic expected to be generated by the proposed project – was estimated based on the proposed project land uses and distributed across the existing transportation network based on observed traffic volumes. After accounting for the impact of project-related traffic on existing conditions, an operational analysis found that five intersections would experience below-standard LOS scores in the morning and/or evening peak period under the Existing plus Project Conditions scenario. The Northbound Off-Ramps at East Boronda Road and East Laurel Drive would operate at LOS E, which is below the minimum standards set by the County CMP. No significant impacts were found on the US 101 study segments in the Existing plus Project scenario.

For this TIA, 2045 is the horizon year for cumulative condition impact analyses. Based on observed volumes in the existing condition, travel behavior forecasting software was used to estimate and distribute future vehicle traffic onto the roadway network in order to test how the proposed project would impact the transportation network. The roadway network improvements included in the City's General Plan, including the eastside and westside bypasses, are reflected in the cumulative analyses.

Under the Cumulative with No Project Conditions scenario, fourteen intersections and three segments of US 101 would operate below local standards. For the Cumulative with Project Scenario, project trip generation for was distributed over the forecasted cumulative volumes. Under this Cumulative with Project Conditions scenario, sixteen intersections would function below local level of service standards during the morning and/or evening peak period. One segment of US 101 was found to operate below the minimum standards in the morning peak period, and three segments failed in the evening peak period. All ramp junctions were found to operate within CMP standards for all cumulative scenarios.

Significant impacts were found as a result of the addition of project traffic in both the existing and cumulative condition scenarios. In the Existing with Project Conditions scenario, significant adverse impacts were identified at five intersections and two ramp junctions; under the Cumulative with Project Conditions scenario, there were impacts at fifteen intersections and three freeway mainline segments. These impacts are largely mitigated through the addition of signal installation and/or optimization, as well as the addition of extra lanes and/or turn pockets. Highway main-line and ramp junction impacts are mitigated with contributions to the Transportation Agency for Monterey County (TAMC) Regional Development Impact Fee Program. No impacts were found with regards to bicycle/pedestrian facilities and public transportation service.

2.0 INTRODUCTION

The City of Salinas (hereafter, "the City") 2002 General Plan establishes policies and goals for future growth. In the past, large tracts of land in the northern part of Salinas (referred to as the North of Boronda Future Growth Area or "FGA") had been set aside for development. The General Plan mandated that the City must adopt specific plans before any development could occur in this area. Thus, the City has prepared the Draft Central Area Specific Plan (hereafter referred to as the "proposed project") to establish the land use planning and regulatory guidance, which will govern the development of central portion of the North of Boronda FGA. Concurrently, the City is also preparing the West Area Specific Plan for the area which adjoins and is located directly west of the proposed project. Although the West Area Specific Plan is not part of the proposed project it is considered in some scenarios, discussed later. In sum the purpose of these plans is to leverage and encourage potential development as well as establish policies, development regulations and design standards that promote walkable communities where a variety of neighborhood amenities can be accessed via walking, biking, or public transit. These specific plan areas are shown in the context of Salinas with **Figure 1.**

The Central Area Specific Plan is approximately 760 acres and shares the boundary of Natividad Road with the West Area Specific Plan. The Central Area Specific Plan is generally bounded by Boronda Road, the future extension of Constitution Boulevard, Old Stage Road, the future Russell Road extension, and Natividad Road. The Central Area Specific Plan would be a master-planned community based on New Urbanism principles. The new community proposes a minimum of 3,419 and a maximum of 3,983 new homes and apartments. In addition to the residential uses, approximately 250,000 square feet of retail and office uses may also be built within the Village Center Mixed Use Zone and a portion of the Neighborhood General-2 (NG-2) Zones. Approximately 100,000 square feet of retail or office square footage could be converted to an additional 100 residential units. These residential and commercial uses will be built within the Plan's Residential/Mixed Use Zoning Districts. Approximately 183 net acres of public streets are included in the plan.

Three school sites are proposed within the Central Area Specific Plan on three parcels for a combined 48 acres. They include a middle school (7th grade through 8th grade) on 18 acres, an elementary school (kindergarten through 6th grade) on 12 acres, and another elementary/middle school (kindergarten through 8th grade) on 18 acres. Also proposed are an approximately 22,000 square foot library on two acres and a fire station on 1.5 acres. **Figure 2** shows the Central Area Specific Plan local circulation network.

The proposed project includes many future land use changes and transportation improvements in the City and may have significant impacts on the transportation network as defined under the California

Environmental Quality Act (CEQA). As such, the purpose of this Transportation Impact Analysis (TIA) is to identify and propose mitigations for any potentially significant impacts of the proposed project on the transportation network. The impacts will be evaluated following guidelines established by the City of Salinas General Plan, relevant Caltrans Policy, and the Monterey County Congestion Management Program (CMP).

Field observations were conducted in order to establish a performance baseline against which to compare the influence of the proposed project. Local roadway and freeway segment volumes, transit service, and bicycle/pedestrian facilities were documented. Travel behavior modelling software was then utilized to forecast traffic patterns for five different scenarios based on the expected land uses of the proposed project, the Salinas General Plan (including the Economic Development Element Target Areas) and observed volumes. The scenarios were chosen to assess how the project would affect the transportation network in isolation and in conjunction with the planned West Area Specific Plan development. These were tested with existing traffic volumes and the forecasted volumes for 2045, as shown below:

1. *Existing Conditions:* Existing volumes collected from field observations.
2. *Existing Plus Project Conditions:* Existing volumes plus traffic generated by the proposed project.
3. *Existing Plus Project and West Area Specific Plan Conditions:* Existing volumes plus traffic generated by the proposed project and the West Area Specific Plan.
4. *Cumulative Conditions:* Projected traffic volumes and planned transportation infrastructure projects for 2045 including traffic generated by pending developments extraneous to the proposed project. All cumulative scenarios include the development contemplated under the Economic Development Element's Target Areas).
5. *Cumulative Plus Project Conditions:* Volumes generated under the *Cumulative Conditions* scenario, plus net traffic generated by implementation of the proposed project.
6. *Cumulative Plus Project and West Area Specific Plan:* Volumes generated under the *Cumulative Conditions* scenario, plus net traffic generated by implementation of the proposed project and the West Area Specific Plan.

Using guidelines set forth by the City, impacts to the transportation network are then identified based on forecasted volumes; mitigations are proposed for facilities where significant impacts are found.

3.0 ANALYSIS METHODOLOGIES AND SIGNIFICANCE STANDARDS

This section documents the methodologies used to determine the level of service scores for selected intersections, ramp junctions, and freeway segments that may be impacted by changes in traffic volume related to the proposed project in the existing and cumulative conditions. Significance standards used to determine impacts are also derived from relevant policy documents and discussed.

3.1 INTERSECTION ANALYSIS METHODS

Intersection operations for vehicles is described with the term "level of service" (LOS). LOS is a qualitative description of traffic flow based on factors such as speed, travel time, delay, and freedom to maneuver. Six levels of service are defined ranging from LOS A (i.e., free flow conditions) to LOS F (over capacity conditions). Typically, LOS E corresponds to operations "at capacity." When volumes exceed capacity, stop-and-go conditions result, and operations are designated as LOS F. The minimum LOS standard for Salinas, as defined by the current General Plan, is LOS D or better; therefore, intersections operating at LOS E or LOS F are considered to be below the minimum threshold. Caltrans and Monterey CMP facilities use the same standard.

There are two primary methodologies used in determining LOS that are derived from the Transportation Research Board's *Highway Capacity Manual* (HCM), published in 2000 and again in 2010. The 2010 HCM methodology was used for the study intersections. If an intersection could not be analyzed using HCM 2010 due to its limitations[1], HCM 2000 was used instead. There are four intersections in the analysis where HCM 2000 was used: US 101 Northbound Ramps and Boronda Road; US 101 Northbound Ramps and West Laurel Drive; West Laurel Drive and Adams Street; East Market Street and East Front Street. The most recent version of the *Synchro* transportation analysis software was used for all intersections, regardless of methodology.

The intersections of East Boronda Road and Main Street, East Boronda Road and US 101 Southbound Ramps, and East Boronda Road and US 101 Northbound Ramps were evaluated using *SimTraffic* to study congested conditions. *SimTraffic* is a microsimulation traffic evaluation tool that captures the random nature of driver behavior and models the interaction between vehicles in a study network. Traffic simulation better accounts for delays under congested conditions including pedestrian crossings, queue blocking, and queue

[1] The 2010 HCM methodology does not analyze intersections with certain configurations including but not limited to: more than four approaches, U-turns, and clustered intersections.

interactions between adjacent intersections when compared to traditional analysis methods, particularly when analyzing closely-spaced intersections.

3.1.1 SIGNALIZED INTERSECTIONS

The operation of signalized intersections is based on various intersection characteristics (such as traffic volumes, lane geometry, and signal phasing) to estimate the average control delay experienced by motorists traveling through an intersection. Control delay incorporates delay associated with deceleration, acceleration, stopping, and moving up in the queue. **Table 1** summarizes the relationship between average delay per vehicle and LOS for signalized intersections.

TABLE 1: SIGNALIZED INTERSECTION LOS CRITERIA

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	$\leq$ 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	> 10.0 to 20.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	> 20.0 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, and/or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	> 35.0 to 55.0
E	Operations with long delays indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.	> 55.0 to 80.0
F	Operations with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.	> 80.0

Source: Highway Capacity Manual (Transportation Research Board)

3.1.2 UNSIGNALIZED INTERSECTIONS

Traffic conditions at unsignalized intersections were evaluated using the method from Chapters 19 (two-way stop control), 20 (all-way stop control) and 21 (roundabouts) of the 2010 *Highway Capacity Manual*. With this method, operations are defined by the average control delay per vehicle (measured in seconds) for each movement that must yield to the right-of-way. At all-way stop-controlled intersections and roundabouts, the weighted average control delay for all movements that must yield to the right-of-way is reported. Roundabouts were evaluated using *Sidra* software. At two-way or side street-controlled intersections, the control delay (and LOS) is calculated for each controlled movement, as well as the left-turn movement from the major street, and the entire intersection. For controlled approaches composed of a single lane, the control delay is computed as the average of all movements in that lane. The delays for the entire intersection and for the movement or approach with the highest delay are reported. **Table 2** summarizes the relationship between delay and LOS for unsignalized intersections.

TABLE 2: UNSIGNALIZED INTERSECTION LOS CRITERIA

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Little or no delays	$\leq$ 10.0
B	Short traffic delays	> 10.0 to 15.0
C	Average traffic delays	> 15.0 to 25.0
D	Long traffic delays	> 25.0 to 35.0
E	Very long traffic delays	> 35.0 to 50.0
F	Extreme traffic delays with intersection capacity exceeded	> 50.0

Source: Highway Capacity Manual (Transportation Research Board).

3.1.3 INTERSECTION ANALYSIS ASSUMPTIONS

Assumptions for certain parameters such as heavy vehicle percentages and a network-wide peak hour were made as the intersection analysis is conducted. A heavy vehicle percentage of 2% was used throughout the entire network, except for designated truck routes where a value of 5% was used. Existing levels of bicycle and pedestrian activity were counted at each study intersection and included in the analysis. Traffic signal timing information was acquired from both the City and Caltrans and verified in the field.

Peak-hour factors were calculated for each individual study intersection; a singular peak hour was used for all study intersections. Although a different peak hour could be observed at each intersection, one peak hour was used for the entire network since the difference in the occurrence of the peak hour and its effect on the results should be minimal. This allows for analysis of intersections in the network during one peak hour opposed to each intersection operating during its individual peak hour.

In the cumulative scenarios, bicycle and pedestrian volumes were scaled up by 40% at intersections adjacent to the project site in order to account for growth in those modes. A minimum threshold of five conflicting bicycles and ten conflicting pedestrians was used to determine the application of scaling. At all other locations, bicycle and pedestrian volumes were scaled up by 15%.

3.2 FREEWAY MAINLINE AND RAMP JUNCTION ANALYSIS METHODS

Freeway mainline segments were analyzed using an internal spreadsheet tool based on the methodology described in Chapter 11 of HCM 2010. This method takes into consideration peak hour traffic volumes, free-flow speeds, percentage of heavy vehicles, and number of travel lanes. These factors are used to determine the vehicle density, measured in passenger cars per mile per lane. The operational performance of ramp junctions at certain locations on the freeway were also analyzed according to a methodology based on the Highway Capacity Manual.

Based on the methodology described in the Transportation Research Board's *Highway Capacity Manual*, ramp merge and diverge analysis determines level of service (LOS) scores for freeway ramp junctions based on the density of entering and exiting traffic along the highway mainline. In this case, LOS describes the traffic and delay experienced by people driving as a result of traffic density on the ramps. It is important to note that the US 101 northbound on-ramp and southbound off-ramp at East Boronda Road were not analyzed because they add or remove an entire lane, thus creating a weaving segment; only ramp diverge or merge segments were analyzed.

3.3 VEHICLE MILES TRAVELLED

The Salinas Travel Demand Model was used to estimate Vehicle Miles Travelled (VMT) for the study area. This was done by multiplying the number of vehicle trips taken by trip length.

3.4 STANDARDS OF SIGNIFICANCE

Local governments and transportation agencies may set minimum Level of Service (LOS) standards for roads based on their classification, importance in the regional network, or other factors. Relevant policy documents and the resultant significance standards are described in this section.

When local ordinance is unclear about impacts at locations that are already failing, significance standards are taken from recent transportation impact analyses conducted in the same area. As such, the City of Salinas General Plan does not include a policy regarding the analysis of an intersection or roadway that is already operating below standard. However, in recent transportation impact studies prepared for the City, the thresholds used state that the addition of any new trips to a facility already exceeding the operating standard is considered a significant impact. A similar criterion is applied to County and Caltrans facilities that are already below operating standards. The impacts of the project were evaluated by comparing the results of the level of service calculations under Project Conditions to the results under Existing Conditions.

3.4.1 THE CITY OF SALINAS

The City of Salinas General Plan (2002) defines city policies regarding future growth and development. The Circulation Element of the General Plan establishes a framework for the transportation system, including the minimum Level of Service scores for City roads. To that end, Policy C-1.2 states that the City shall "strive to maintain traffic Level of Service (LOS) D or better for all intersections and roadways." Furthermore, Policy C-1.3 states that these standards must be maintained with the addition of new development. The standards and goals reflected in these policies will be accounted for in the existing and future operations analysis of this report.

The City of Salinas Bikeways Plan (2002) and City of Salinas Pedestrian Plan (2004) elaborate city policy with regards to the bicycle and pedestrian network. They also establish a prioritized list of projects as well as their cost for implementation. These plans illustrate the ideal bicycle and pedestrian network for the City.

The Central Area Specific Plan establishes land use designations, policies, development regulations and design standards for the Specific Plan area. With regards to transportation, the Plan defines a typology for local streets and the arterial roadways that bound the Central Area Specific Plan project area (shown earlier in **Figure 2**).

For the purposes of this TIA, impacts to bicycle, pedestrian, or transit service would occur if the implementation of the proposed project results in inadequate service and access for people using these modes, or if it would conflict with adopted polices, plans, or programs that support such modes.

Therefore, standards of significance for local intersections, pedestrian and bicycle facilities, and transit service is defined as follows:

3.4.1.1 Local Intersections

Significant impacts at signalized intersections are defined to occur when:

- The addition of project traffic causes intersection operations to degrade from an acceptable level (LOS D or better) to an unacceptable level (LOS E or worse); or
- Project traffic is added to an intersection operating at an unacceptable level (LOS E or worse).

Significant impacts at unsignalized intersections are defined to occur when:

- The addition of project traffic causes intersection operations (either the intersection as a whole or the worst movement for a two-way stop-controlled intersection) to degrade to an unacceptable level and satisfy the peak-hour signal warrant from the *Manual on Uniform Traffic Control Devices* (MUTCD); or

- The project's access to a major street causes a potentially unsafe situation or requires a new traffic signal or roundabout based on standard warrant criteria.

3.4.1.2 Pedestrian and Bicycle Facilities

Significant impacts to pedestrian and bicycle facilities are defined to occur when:

- The project conflicts with existing or planned pedestrian or bicycle facilities; or
- The project creates pedestrian and bicycle demand without providing adequate facilities.

3.4.1.3 Public Transportation

Significant impacts to public transportation services are defined to occur when:

- The project conflicts with existing or planned transit facilities; or
- The project generates potential transit trips without providing adequate transit service or facilities, such as stops or shelters.

3.4.2 CALTRANS FACILITIES

Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D on State Highway facilities (*Guide for the Preparation of Traffic Studies*, Caltrans, December 2002); however, Caltrans has acknowledged that such a goal may not always be feasible. A standard of LOS D or better was used as the planning objective for the evaluation of potential impacts of this development on Caltrans facilities as that is the standard set for Caltrans facilities in the study area by the Monterey CMP.

3.4.3 MONTEREY COUNTY

Some roadway segments in this report fall within the unincorporated areas of Monterey County. As such, the applicable level of service standards from the Monterey County General Plan Circulation Element will be applied. In this case, Policy C-1.1 of the plan states that "the acceptable level of service for County roads and intersections shall be Level of Service (LOS) D."

Therefore, significant impacts at mainline freeway segments and ramp junctions are defined to occur when:

- The addition of project traffic causes freeway mainlines or ramp junction operations to degrade from an acceptable level (LOS D or better) to an unacceptable level (LOS E or worse), or
- Project traffic is added to a freeway mainline or ramp junction operating at an unacceptable level (LOS E or worse).

4.0 EXISTING CONDITIONS ANALYSIS

This chapter describes the transportation network around the study area as it exists today. The results of an existing conditions analysis using methods, assumptions, and significance standards are discussed.

4.1 EXISTING ROADWAY NETWORK

This section describes these existing roadway facilities relevant to the proposed project, which are shown in **Figure 3** below.

4.1.1 NORTH/SOUTH ROADWAYS

U.S. Route 101 (US 101) is a north-south, four-lane freeway extending through the City of Salinas. The highway becomes a six-lane freeway between Boronda Road and Russell Road, through the north City limits of Salinas. The intersection of US 101 and major roadways in Salinas are either an interchange or grade separated overpass.

San Juan Grade Road is a four-lane roadway south of Boronda Road that intersects at North Main Street and continues as two-lane roadway north of Boronda Road. The posted speed limit is 45 mph. Major intersections are controlled by traffic signals and minor intersections are controlled by side street stop control, with San Juan Grade Road as a free flow roadway. Sidewalks and striped Class II bicycle lanes are provided on San Juan Grade Road between Northridge Way and Main Street. Intermittent sidewalks are provided on some portions of the roadway between Russell Road and Rogge Village Way.

McKinnon Street is two-lane collector with bicycle lanes and sidewalks that connects with Boronda Road and Alvin Drive. The posted speed limit is 35 mph.

El Dorado Drive is a two-lane collector with bicycle lanes and sidewalks that connects with Boronda Road and Alvin Drive, with a two-way left turn lane between Harden Parkway and Alvin Drive. The posted speed limit is 25 mph.

Natividad Road is a six-lane divided major arterial from East Laurel to East Boronda Road with a posted speed limit of 40 mph. A portion of Natividad Road, between East Boronda Road and Los Coches Drive, has sound walls on each side of the roadway. Natividad Road is a two-lane rural roadway north of East Boronda Road. South of East Bernal Drive, this road is known as Sherwood Drive, a 4-lane arterial.

North Main Street is a six-lane divided major arterial between US 101 in the south and East Boranda Road in the north with a posted speed limit of 35 miles per hour in this section. South of US 101 to East Market Street, North Main is a four-lane undivided arterial with a two-way left turn lane. At the terminus it transitions into a couplet with Salinas Street continuing southbound, while Monterey Street provides northbound access.

Alisal Road is a two-lane rural road with a posted speed limit of 55 miles per hour. It runs from Spence Road in the east to East Alisal Street/Bardin Road at the Salinas City Limit. Alisal Road borders the Salinas Municipal Airport to the north but does not provide direct access to it.

Independence Boulevard is a divided collector roadway extending from Boronda Road to Constitution Boulevard. It provides Class II bicycle lanes along with a continuous sidewalk on the eastern side of the roadway for its entire length. Independence Boulevard is four lanes wide from Boronda Road to Nantucket Boulevard and two lanes wide south of Nantucket Boulevard.

Sanborn Road is a four-lane major arterial roadway connecting Boronda Road in the north with Abbott Street in the south. Traffic signals are provided at all major intersections and a full interchange with US 101 provides access to regional destinations. Continuous sidewalks are provided on both sides of Sanborn Road for its entire length. Striped Class II bicycle lanes have been installed on the segment of Sanborn Road north of Del Monte Avenue (to Boronda Road).

4.1.2 EAST/WEST ROADWAYS

Russell Road begins at the Espinosa Road/Russell Road interchange with US 101 and extends east to San Juan Grade Road. Russell Roadway provides two through lanes of travel (one in each direction), widening to provide additional turn lanes at intersections. The posted speed limit ranges from 35 to 45 mph. Intermittent sidewalks are provided along some sections of the facility.

Boronda Road begins at the Boronda Road interchange with US 101 as a six-lane major arterial to North Main Street. East of North Main Street, Boronda Road transitions to two lanes eastbound and three lanes westbound to San Juan Grade Road. East Boronda Road then narrows to a two-lane arterial east of Dartmouth Way until it terminates at Williams Road. Traffic signals control the intersections of Boronda Road and all major arterials.

The City of Salinas has plans to widen and improve Boronda Road between Dartmouth Way and Independence Boulevard, including the installation of roundabouts at major intersections. On May 16, 2017, the City Council approved the roundabout concept along East Boronda Road at the following intersections: McKinnon Street, El Dorado Drive, Natividad Road, Independence Boulevard, and Hemingway Drive. The project will widen East Boronda Road into a four-lane roadway with landscaped median, and bike lanes. The existing bridge over Gabilan Creek (near Independence Boulevard) will also be widened to accommodate the four-lane roadway with bike lanes and sidewalks.

The widening project will occur in three phases. The first phase of the project would include widening of East Boronda Road from just east of Dartmouth Way to approximately 1,900 feet east of McKinnon Street for a total length of approximately 3,500 feet. It would include a roundabout at the intersection of McKinnon Street and East Boronda Road. This phase of the project is underway and currently nearing completion of the planning, environmental and design stages.

The second phase of the project would continue the widening of East Boronda Road from the Phase 1 limit to approximately 1,100 feet east of Natividad Road. It would also include roundabouts at the intersections of El Dorado Drive and Natividad Road. The remainder of the improvements including the widening of the bridge crossing Gabilan Creek, and the construction of a roundabout at the intersection of Independence Boulevard and East Boronda Road would be constructed as the last phase of the project. A roundabout at Hemmingway Drive may also be included as part of this final phase, pending further study.

Rogge Road is a two-lane collector connecting San Juan Grade Road and Natividad Road. The speed limit ranges from 55 mph to 25 mph (school zone). Sidewalks and a striped Class II bicycle lane are provided on the section of Rogge Road between Natividad Road and La Joya Elementary School. Intermittent facilities are provided west of La Joya Elementary.

Williams Road is a four-lane divided arterial with left-turn lanes between Del Monte Avenue and Freedom Parkway. Between Del Monte Avenue and East Alisal Street, Williams Road is a four-lane arterial with a center turn lane and left turn lanes. There is a painted bicycle lane between Freedom Parkway and Bardin Way.

Constitution Boulevard is a divided four-lane minor arterial roadway extending from Laurel Drive to Boronda Road. The facility provides striped Class II bicycle lanes and sidewalks on both sides of the roadway.

4.2 TRUCK ROUTES

US 101 and city-designated truck routes serve the primary industrial areas of the community. These roads are intended to move goods efficiently within the City, between outlying agricultural uses, and packing/distribution centers. Additionally, they serve to separate truck traffic from local streets where the larger vehicles may conflict with other uses.

Aside from US 101, the following roads in part or in whole serve as truck routes on City streets:

- Blanco Road
- Davis Road
- Boronda Road
- Williams Road
- Alisal Street
- Skyway Boulevard
- Airport Boulevard
- Sanborn Road
- Laurel Drive

As shown in **Figure 4**, these roads combine to form concentric rings that provide access to existing industrial uses and shipping centers throughout the City.

4.3 EXISTING PEDESTRIAN FACILITIES

Pedestrian facilities consist of sidewalks, curb ramps, crosswalks, and off-street paths, among other things. These facilities should provide safe and convenient routes for people walking to traverse the City. Pedestrian facilities are typically identified in the jurisdiction's General Plan as part of the transportation or circulation element, along with any proposed improvements or extensions to the existing pedestrian network. Policies and programs relating to walking in Salinas are defined in the City of Salinas Circulation Element Goal C-5 and the 2004 Salinas Pedestrian plan.

Pedestrian facilities exist in Salinas to varying degrees of comprehensiveness. Improved pedestrian facilities typically correspond to recent development, while roads adjacent to agricultural uses or undeveloped lots typically do not provide pedestrian facilities, which is common in urbanizing communities. Near the project area, wider sidewalks were more common in the presence of schools.

Pedestrian facilities relevant to the proposed project areas are listed below:

- **San Juan Grade Road** has intermittent facilities on the east and west sides of the street between Boronda Road and Rogge Road.
- **Constitution Boulevard** provides continuous standard sidewalks for its entire length, from the project's southern boundary at East Boronda Road to Laurel Drive.
- **Independence Boulevard** provides continuous standard sidewalks along the eastern side of the roadway for its entire length, from the project's southern boundary at East Boronda Road to Constitution Boulevard. On the western side, the facility is missing sidewalk along the links connecting directly to both East Boronda Road and Constitution Boulevard.
- **East Boronda Road** has a continuous southerly sidewalk for its entire length of approximately four miles from Williams Road and San Juan Grade Road, in the form of a curvilinear path – sometimes with landscaped vegetation – that parallels the roadway. The path is approximately 9 feet wide from Williams Road to San Juan Grade Road. Sidewalk switches to the north side of the road between San Juan Grade and North Main Street.
- **McKinnon Street** is equipped with approximately 9-foot sidewalks on the western side between Boronda Road and East Alvin Drive. Western side has an approximately 9-foot sidewalk between East Alvin Drive that narrows into approximately five feet approximately 400 feet south of Westminster Drive. McKinnon Street does not have sidewalks for 1,000 feet north of Boronda in the proximity of McKinnon Elementary School.
- **Natividad Road** has sidewalks are present on at least one side of the street between East Laurel Drive and Boronda Road. There are no sidewalks present north of Boronda Road.

- **Rogge Road** has been recently improved between San Juan Grade Road and Jasper Way. On this section, the sidewalk on the north and south side of the street. The sidewalk is approximately ten feet wide; the southern sidewalk narrows to approximately five feet west of Rogge Village Loop. No sidewalks are present east of Jasper Way.
- **Williams Road** has continuous sidewalks present between Alisal Street and Freedom Parkway, where it passes through entirely urban land uses. In the proximity of Alisal High School, the sidewalk widens and parallels the road in a curvilinear fashion similar to the facility on Boronda Road. Between Freedom Parkway and Boronda Road, the sidewalk is only present on the north side of the street, in correlation with the residential land use present there; the south side of the street is agricultural use. North of Boronda Road, the adjacent land use is entirely agricultural, and no sidewalks are present.
- **Old Stage Road** is a rural road serving mostly agricultural uses. It does not have any sidewalks.

Existing pedestrian facilities may have barriers in the form of signposts, utility poles, or overgrown vegetation. Such barriers can also provide challenges to the access requirements for those with disabilities, as mandated in Americans with Disabilities Act (ADA). As parcels are developed and required to install sidewalks, there can also be gaps in the sidewalk system when adjacent parcels are not redeveloped or vacant.

4.4 EXISTING BICYCLE FACILITIES

Bicycle facilities consist of paths (Class I), lanes (Class II), and routes (Class III). Bicycle paths are paved trails that are separate from roadways. Bicycle lanes are separate areas on roadways designated for bicycle use by striping, pavement legends, and signs. Bicycle routes are roadways designated for bicycle use by signs only but may not include substantial width for bicycle travel. Like pedestrian facilities, bicycle networks are typically included in the General Plan, along with any proposed improvements or extensions. The list of existing bicycle facilities is summarized below and shown on **Figure 5** based on the 2002 Salinas Bicycle Plan and cross-checked against field observations.

4.4.1 CLASS I SHARED-USE PATHS

- Rossi Rico Parkway
- Natividad Creek Park Trail
- Gabilan Creek Bike Path
- Front-Sherwood Underpass

4.4.2 CLASS II BICYCLE LANES

- Williams Road
- Freedom Parkway
- North Sanborn Road between Del Monte Ave and East Boronda Road
- Constitution Boulevard
- Independence Boulevard
- East Boronda Road between Williams Road and North Davis Road
- North Davis Road between Boronda Road and SR 183
- South Davis Road between SR 183 to Blanco Road
- Nantucket Boulevard
- Rider Avenue
- Hemingway Drive
- El Dorado Drive
- Harden Parkway
- McKinnon Street
- East Alvin Drive between Kip Drive and North Main Street
- North Main Street between East Alvin Drive and San Juan Grade Road
- San Juan Grade Road between East Boronda Road and North Main Street
- Harden Parkway
- East and West Rossi Street
- Pajaro Street Between East Market Street and East San Joaquin Street
- South Main Street between East San Joaquin Street and Stephanie Drive
- East Alisal Street between Front Street and North Madeira Avenue
- Work Street between East Alisal Street and John Street
- Abbott Street between John Street and Harkins Road
- Front Street between East Alisal Street and John Street
- Laurel Drive between Constitution Boulevard and Saint Edwards
- Sherwood Drive

4.4.3 CLASS III ROUTES

These facilities are ubiquitous throughout Salinas neighborhoods and are typically located on low-volume local streets.

4.5 EXISTING TRANSIT SERVICE

Monterey-Salinas Transit (MST) provides fixed-route bus service in Monterey County and in the City of Salinas. Most routes in Salinas follow a hub-and-spoke service pattern, originating and returning to the Salinas Transit Center in downtown Salinas. Express and commuter busses are also provided to regional destinations in Monterey and Santa Cruz counties. As of 2014, MST experiences about 14,000 passenger trips on an average weekday.[2] **Figure 6** shows a map of transit bus service in Salinas.

The proposed project is served by MST routes 41, 45, 49, 72 and 95. Many of these routes start at the Downtown Salinas Transit Center and end at the Northridge Mall, in the northwest corner of the city. **Table 3** below summarizes the hours of operation and service frequencies of these routes. Routes 45, 72 and 95 have stops on East Boronda Road near San Juan Grade Road, McKinnon Street, El Dorado Drive, Shaker Square (a retail shopping center), Natividad Road, and Independence Road.

TABLE 3: EXISTING TRANSIT SERVICE

Route #	Route Name/Destination	Weekday	Saturday	Sunday	Commute Headway (peak hour)
41	Northridge via East Alisal	5:17 AM – 10:16 PM	5:55 AM -10:14 PM		30 Minutes
45	Northridge via East Market	Daily: 7:00 AM – 7:00 PM			75 minutes
49	Santa Rita via Northridge	Daily: 6:15 AM – 10:00 PM			60 Minutes
72	Presidio – North Salinas Express	6:00 AM – 6:15 PM	n/a		1 AM Trip/1 PM Trip
95	Northridge – Williams Ranch	Daily: 7:02 AM – 5:20 PM			120 Minutes

4.7 EXISTING WITH NO PROJECT ANALYSES

Intersection turning movement and US 101 segment volumes were collected on midweek days in January, February, and April of 2016. **Figure 8** illustrates the existing turning movement volumes at the study intersections. Volumes were collected in January and February to capture school-related travel. However, in order to account for possible seasonal variances in traffic volume due the local context of Salinas, a volume adjustment factor for these winter counts was considered. Using prior data collected by the City from the summer of 2015, winter counts were found to be larger than summer counts by about 2 percent. Such a variance is likely due to simple day-to-day fluctuations in travel behavior, and as such an adjustment factor for winter volumes was ultimately not used.

4.7.1 EXISTING WITH NO PROJECT CONDITIONS INTERSECTION OPERATIONS ANALYSIS

Existing level of service levels were evaluated at 54 intersections in Salinas, presented in **Table 4**, below. Intersections that function below the minimum threshold (LOS D) in either the morning or evening peak period are shown in bold.

Source: Fehr & Peers, 2019
AWSC = All-Way Stop Control, SSSC = Side Street Stop Control, LOS = Level of Service
Notes:

- *Side-street stop-controlled (SSSC) intersection LOS is reported as: overall intersection delay and LOS (worst-case stop-controlled movement or approach delay and LOS).*
- *All-way stop controlled (AWSC) LOS is reported for the overall intersection, based on average delay per vehicle*

Currently, four intersections operate at a level of service below the City threshold of LOS D or better during the morning and/or evening peak period. Of these, only two intersections function at LOS F in either peak period: Hemingway Drive & Boronda Road, and North Sanborn Road & Boronda Road.

4.7.2 EXISTING WITH NO PROJECT CONDITIONS FREEWAY MAINLINE CAPACITY ANALYSIS

Traffic volume observations were recorded at ten locations along US 101 by Fehr & Peers in the spring of 2016, during the same period as the intersection turning movement counts. For freeway mainline segments, level of service (LOS) is a function of traffic density and describes the resulting delay experienced by people driving. LOS scores are compared to the minimum operating standards defined by the Monterey County CMP in **Table 5** and **Table 6** below.

TABLE 5: AM EXISTING WITH NO PROJECT FREEWAY MAINLINE OPERATION ANALYSIS

All of the analysis segments operate at or above the minimum level of service standards for highway facilities as set by the CMP, LOS D or better.

4.7.3 EXISTING WITH NO PROJECT CONDITIONS FREEWAY RAMP JUNCTIONS CAPACITY ANALYSIS

The existing operational performance of merging and diverging ramp junctions was analyzed at the Boronda Road and Laurel Street interchanges of US 101. Ramp junction merge and diverge movement level of service results for the northbound and southbound segments, in the morning and evening peak periods, are shown and compared to minimum operational standards in **Table 7** and **Table 8,** below.

TABLE 7: AM EXISTING WITH NO PROJECT RAMP JUNCTION MERGE AND DIVERGE ANALYSIS

Currently, all ramp junction merge and diverge movements operate at acceptable levels of service during the morning and evening peak periods.

5.0 PROJECT CONDITIONS

This chapter documents the results of an existing plus project analysis which examines the impact of the Central Area Specific Plan on the transportation network, assuming that full buildout of the plan would occur absent of other growth assumptions that are included in the cumulative scenarios. Additionally, an adjacent project – the West Area Specific Plan – is also described and considered for some scenarios. Project descriptions and trip generation assumptions for both are discussed. The results of this analysis are also presented.

5.1 PROJECT DESCRIPTIONS

In this Transportation Impact Analysis, the Central Area Specific Plan is considered to be the proposed project. However, the West Area Specific Plan (currently under consideration) is considered simultaneously in some existing and future growth scenarios in order to evaluate the impact of the West Area Specific Plan together with the Central Area Specific Plan, as well as the baseline growth assumptions. The next two sections describe each plan in more detail.

5.1.1 CENTRAL AREA SPECIFIC PLAN

The Central Area Specific Plan is approximately 760 acres and shares the boundary of Natividad Road with the West Area Specific Plan. The Central Area Specific Plan is generally bounded by Boronda Road, the future extension of Constitution Boulevard, Old Stage Road, the future Russell Road extension, and Natividad Road.

Like the West Area Specific Plan, the Central Area Specific Plan is also a master-planned community based on New Urbanism principles. The new community proposes a minimum of 3,419 and a maximum of 3,983 new homes and apartments. In addition to the residential uses, approximately 250,000 square feet of retail and office uses may also be built within the Village Center Mixed Use Zone and a portion of the Neighborhood General-2 (NG-2) Zones. Approximately 100,000 square feet of retail or office square footage could be converted to an additional 100 residential units. These residential and commercial uses will be built within the Plan's Residential/Mixed Use Zoning Districts. Approximately 183 net acres of public streets are included in the plan.

Three school sites are proposed within the Central Area Specific Plan on three parcels for a combined 48 acres. They include a middle school (7th grade through 8th grade) on 18 acres, an elementary school (kindergarten through 6th grade) on 12 acres, and another elementary/middle school (kindergarten through

8th grade) on 18 acres. Also proposed are an approximately 22,000 square foot library on 2 acres and a fire station on 1.5 acres.

For the purposes of analysis, the following land use assumptions have been made:

- Residential: full buildout of 3,983 dwelling units
- Mixed Use Commercial: 125,000 square feet of office, 125,000 square feet of retail
- Schools: two elementary schools with 600 students enrolled in each and one middle school with 803 students enrolled
- Other: 50 acres of parks, 30 acres of utilities, 22,000 square feet of libraries

5.1.1.1 Internal Circulation System

The Central Area Specific Plan circulation system will include a roadway network, a pedestrian and bicycle network, and public transit. The Central Area Specific Plan emphasizes ensuring connectivity between uses and on creating a safe and efficient circulation system that complies with City of Salinas policies. These design principles put an emphasis on facilitating increased daily pedestrian and bicycle trips by connecting residences in a safe and convenient grid system to public transit, public facilities, parks and neighborhoods, and to retail and employment opportunities. The proposed traditional neighborhood grid street layout provides for shorter walking/bicycling distances than the “modern” walled neighborhoods with limited access points.

The circulation system is designed to link with existing city and regional transit, street, bike and pedestrian systems, as well as the other planned developments for the other Future Growth Areas, the East Area and West Area Specific Plan Areas.

The proposed vehicular circulation plan aims to slow traffic within the neighborhoods while still allowing convenient and safe access to the new neighborhoods, as well as good linkages between the new neighborhood and the existing City. The Central Area Specific Plan emphasizes facilitating increased daily pedestrian trips by connecting residential neighborhoods to public facilities such as schools and parks, and to employment areas.

The overriding concept of the “walkable neighborhood” suggests that the safe movement of pedestrians is critical. Visitors, workers and residents may arrive in the neighborhood by vehicles, but they quickly enter the realm of the pedestrian, who moves no more than four miles per hour. Although the street design focus must be on the pedestrian and bike, many types of transportation are accommodated and brought into balance within the proposed neighborhood streetscape. Limited lane widths, two-way traffic, on-street parking, tighter curb radii, narrow street crossings (bulb outs), speed tables (flat-topped speed bumps for traffic calming), small scale roundabouts, added stop signs, ample sidewalks, wide landscaped parks strips, and the promenade with homes and businesses facing the street, and minimizing driveways in front (which interrupt the sidewalk and result in cars parked in the front setback). These are all key elements of a walkable, pedestrian-first strategy. These standards will be established in the right-of-way's of the Specific Plan Area in order to balance out its use by drivers, bicyclists and pedestrians. In the transition between Village Center and Neighborhood Edge, the ingredients of the street design vary by location to generate a quality of place and a character that varies from place to place within the neighborhood.

5.1.1.2 Pedestrian Circulation

The Central Area Specific Plan endeavors to encourage a walkable community by providing accessible and safe movement of pedestrians within the Specific Plan Area with access to the surrounding neighborhoods. Sidewalks will be provided along both sides of all internal streets, but not alleyways. Walkways through commercial areas will also extend the path of travel from sidewalks to access on-site destinations. ADA accessibility will be maintained through pedestrian path of travel and connections. Design of the Village Center will accommodate pedestrian circulation with 15-foot wide sidewalks and safe access routes to all proposed parking areas. Pedestrians will be able to access all buildings and uses within the Specific Plan Area. Sidewalks will be a minimum of five feet wide in residential areas and eight feet wide along school and park frontages.

The Central Area Specific Plan will have a fully landscaped greenway (The Promenade) running along the entire length of the Southerly Greenway Street (from east to west). The Promenade will have a 12 to 14-foot wide Class I concrete pedestrian/bicycle route connecting the East and West Future Growth Areas through the Specific Plan Area.

5.1.1.3 Bicycle Circulation

The existing bicycle network in Salinas consists of Class I, II and III bikeways, which cover significant portions of north, south and east Salinas. A Class I bike path currently exists adjacent to Natividad Creek and under the PG&E tower lines adjacent to Hemingway Drive. As part of the proposed project, this Class I bike path is planned to be extended into the Specific Plan Area. Class II bike lanes currently exist and are planned to be extended around the Specific Plan Area on East Boronda Road, Constitution Boulevard, Independence Boulevard, Hemingway Drive, Natividad Road, Russell Road, and Old Stage Roads.

The Central Area Specific Plan would encourage the use of alternative modes of transportation by incorporating bicycle and pedestrian friendly designs through an integrated system of roads, footpaths and bikeways. At buildout, bike lanes in the east-west direction are planned to be provided along both sides of the future Russell Road, Old Stage Road, and on the north side of the Southerly Greenway Promenade and along the north side of East Boronda Road. In the north-south direction, bike lanes are planned to be provided along Natividad Road, both creeks, and Constitution Boulevard.

5.1.2 WEST AREA SPECIFIC PLAN

The West Area Specific Plan encompasses approximately 797 acres. It is relatively flat land bounded by the future Russell Road and Rogge Road extensions to the north, Natividad Road to the east, Boronda Road to the south, and San Juan Grade Road to the west. Regional access to the site is provided by State Route 101, located 0.5 mile west of the project site, and by Boronda Road, which connects to State Route 101 and forms the south boundary of the West Area Specific Plan. In the southwest portion of the site is the existing McKinnon Elementary School, which is surrounded by agricultural fields and is not a part of the project. Two small clusters of buildings supporting the agricultural operations are located on the project site. A new high school is under construction in the northwest portion of the site.

The West Area Specific Plan will guide the development of a master-planned community consisting of approximately 4,340 residential units in four residential neighborhoods and a minimum of 91 residential units within the Village Center. The overall average residential density within the Specific Plan area must equal or exceed 9 dwelling units per net residential developable acre (4,340 units). In addition, approximately 571,500 square feet of mixed use residential and commercial development is also proposed within the Village Center area, and a maximum of 250,000 square feet of the mixed use commercial square footage could be converted to residential units. Also proposed (all acreages are approximate) is a 30-acre community park, four neighborhood parks totaling 12 acres, six small parks totaling six acres, 35 acres of open space/supplemental detention and retention basins, a 1.5 acres of water well/treatment facilities, three elementary schools on a combined 31 acres, a middle school on 21 acres, and a high school on 39 acres. The mixed used development in the Village Center could include a grocery store, shops, restaurants, offices and residential units.

For the purposes of this analysis, the following assumptions were made regarding school enrollment in the West Area Specific Plan:

- There will be 600 students enrolled in each of the three elementary schools, totaling 1,800 students.
- The middle school will contain the average California enrollment of 803 students.
- The High School is projected to have 1,534 students and a commensurate number of staff

The new schools are expected to primarily serve students living in the project area and/or areas immediately surrounding.

5.1.3 TRIP GENERATION

Trip generation refers to the process of estimating the amount of vehicular traffic a project might add to the local roadway network. Using available data, the expected level of vehicle trip generation during the peak one-hour periods during the morning (AM) and evening (PM) peak hours, when traffic volumes on adjacent streets are typically at their highest, was calculated.

Fehr & Peers' trip generation tool, MainStreet, was used to estimate trip generation for this project. The MainStreet application combines Institute of Transportation Engineers (ITE) methods and Big Data to provide a more robust analysis platform as an alternative to using only the ITE Trip Generation Manual, a more traditional analysis method. The Trip Generation manual contains data primarily collected at suburban, single-use, freestanding sites, which can overestimate vehicle trip generation. This is due to an inability of traditional tools to accurately reflect the amount of internal trip linking or the level of trips made by transit, biking, and/or walking. This can result in increased development costs due to oversized infrastructure and skewed perceptions of likely impacts. MainStreet begins with ITE trip generation estimates, but then adjusts those estimates to account for internal trips. MainStreet also recognizes that traffic generation relates closely to the density, diversity, design, destination accessibility, transit proximity, and scale of development, providing a more accurate and realistic trip generation estimate. Because the proposed project intends to use new urbanist design principles that include mixed use development, the MainStreet tool is more appropriate than trip generation rates which strictly rely on the ITE methodology.

The genesis of the MainStreet tool was a US Environmental Protection Agency (EPA) sponsored national study of the trip generation characteristics of multi-use sites. Travel survey data was gathered from 239 mixed-use developments (MXDs) in six major metropolitan regions, and correlated with the characteristics of the sites and their surroundings. The findings indicate that the amount of external traffic generated is affected by a wide variety of factors including the mix of employment and residents, the overall size and density of the development, the internal connectivity for walking or driving among land uses, the availability of transit service, and the surrounding trip destinations within the immediate area outside the Project site.

These characteristics were related statistically to trip behavior observed at the study development sites using statistical techniques. These statistical relationships produced equations, known as the EPA MXD model, that allows predicting external vehicle trip reduction as a function of the MXD characteristics. Applying the external vehicle trip reduction percentage to "raw trips", as predicted by ITE, produces an estimate for the number of vehicle trips traveling in or out of the site.

The MXD model has been approved for use by the EPA[3]. It has also been peer-reviewed in the ASCE Journal of Urban Planning and Development[4], peer-reviewed in a 2012 TRB paper evaluating various smart growth trip generation methodologies[5], recommended by SANDAG for use on mixed-use smart growth developments[6], promoted in an American Planning Association (APA) Planning Advisory Service (PAS)[7] which recommended it for evaluating traffic generation of mixed-use and other forms of smart growth, including in-fill and transit oriented development, It has also been used successfully in numerous certified EIRs in California.

Trip generation estimates for the Central Area Specific Plan are presented below in **Table 9**. Trip generation estimates for the West Area Specific Plan are presented in **Table 10.**

5.1.4 TRIP DISTRIBUTION

New traffic generated by the Central Area Specific Plan and the West Area Specific Plan was distributed through the roadway network using a trip distribution pattern developed using the City of Salinas Travel

Demand Model. The distribution used for Central Area Specific Plan-related traffic is shown on **Figure 9.** **Figure 10** illustrates the assignment of project generated trips to the study intersections.

5.2 PROJECT CONDITIONS NETWORK CHANGES

A number of changes to the network under the project conditions scenarios were assumed. The assumptions are detailed below.

5.2.1 EXISTING PLUS PROJECT NETWORK ASSUMPTIONS

- Widen Boronda Road to 4 lanes from San Juan Grade to Constitution Boulevard
    - Boronda Road & McKinnon Street – 2 lane roundabout
    - Boronda Road & El Dorado Drive – 2 lane roundabout
    - Boronda Road & Natividad Road – 3 lane roundabout
    - Boronda Road & Independence Boulevard – 2 lane roundabout
- Widen Russell Road to 4 lanes from San Juan Grade to Natividad Road (new road)
- Widen Natividad Road to 4 lanes from Boronda to Rogge Road
- Widen Old Stage Road to 4 lanes from Russell Road to Constitution Boulevard
- Extend the following roadways north of East Boronda Road: El Dorado Drive, Independence Boulevard, and Hemingway Drive (new road)
- The Hemingway Drive & Boronda Road intersection is evaluated as a signalized intersection with all movements permitted; however, a roundabout could be provided at this location that would provide a similar capacity and level of service.
- Extend Constitution Boulevard as 4-lane arterial to Old Stage Road (new road)
- The following intersections where the Central Area Specific Plan's internal roadways intersect with the City's roadway network were assumed to be full access intersections (i.e. movements are permitted in all directions): Natividad Road & Southernly Greenway, Natividad Road & Northernly Greenway, Constitution Boulevard & Southernly Greenway, Constitution Boulevard & Northernly Greenway, Independence Boulevard & Russell Road, Road C-5 & Russell Road and Northerly Greenway & Russell Road.
- The following intersections on Boronda Road would also be provided with the allowable movements as noted below:
    - Right in/Right out only – Commercial access between Independence Boulevard and Natividad Road;
    - Right in/Right out only – Access between Road AC and Hemingway Drive; and
    - Right in/Right out/Left in only – Road AC and Boronda.

5.3 EXISTING PLUS PROJECT CONDITIONS ANALYSIS

5.3.1 EXISTING PLUS PROJECT CONDITIONS INTERSECTION OPERATION ANALYSIS

Vehicle volumes associated with the proposed project were distributed across the existing transportation network, resulting in the volumes shown in **Table 11** below. These volumes reflect the anticipated impacts that the proposed project would have today, all other things being equal. Intersections that experience significant impacts in either the morning or evening peak period are shown in bold.

Source: Fehr & Peers, 2019
AWSC = All-Way Stop Control, SSSC = Side Street Stop Control, LOS = Level of Service
Notes:

- *Side-street stop-controlled (SSSC) intersection LOS is reported as: overall intersection delay and LOS (worst-case stop-controlled movement or approach delay and LOS).*
- *All-way stop controlled (AWSC) LOS is reported for the overall intersection, based on average delay per vehicle*

Overall, five intersections experience failing LOS scores in the morning and/or peak period in the Existing Plus Project conditions scenario.

These constitute significant impacts, mitigations for which are discussed in depth in the Impacts and Mitigations chapter at the end of this report.

5.3.2 EXISTING PLUS PROJECT CONDITIONS FREEWAY CAPACITY ANALYSIS

Table 12 and **Table 13** show the results of the freeway mainline capacity analysis for US 101 in the Existing Plus Project Condition in the morning and evening peak hour, respectively.

TABLE 15: PM EXISTING PLUS PROJECT RAMP JUNCTION MERGE AND DIVERGE ANALYSIS

Location	Southbound			Northbound		
	Ramp Type	DR (pc/mi/ln)	LOS	Ramp Type	DR (pc/mi/ln)	LOS
Boronda Road	Loop On-Ramp	22.6	C	Loop On-Ramp	20.7	C
	On-Ramp	24.5	C	**Off-Ramp**	**35.1**	**E**
West Laurel Drive	Off-Ramp	29.1	D	On-Ramp	31.4	D
	On-Ramp	21.2	C	Loop On-Ramp	27.8	C
				Off-Ramp	**35.6**	**E**

Source: Fehr & Peers, 2019

The US 101 Northbound Off-ramp at East Boronda Road and East Laurel Avenue perform at LOS E in the evening peak period, which is below standards set by the County CMP.

5.4 EXISTING PLUS PROJECT AND WEST AREA SPECIFIC PLAN CONDITIONS

The Existing Plus Project and West Area Specific Plan Conditions Scenario incorporates the combined effect of the Central Area Specific Plan and the West Area Specific Plan on the local transportation network. Because the projects are adjacent to each other, it can be assumed that they will have a combined influence on the nearby transportation network once they are both complete. As such, that impact is analyzed in this section.

5.4.1 EXISTING PLUS PROJECT AND WEST AREA SPECIFIC PLAN CONDITIONS INTERSECTION LEVEL OF SERVICE

The expected trip generation for the Central Area Specific Plan and the West Area Specific Plan were overlaid on the existing conditions on the local transportation network. The magnitude of this effect on study intersections is documented by **Table 16** below.

TABLE 16: EXISTING PLUS PROJECT AND WEST AREA SPECIFIC PLAN INTERSECTION LEVEL OF SERVICE ANALYSIS

AWSC = All-Way Stop Control, SSSC = Side Street Stop Control, LOS = Level of Service
Notes:

- *Side-street stop-controlled (SSSC) intersection LOS is reported as: overall intersection delay and LOS (worst-case stop-controlled movement or approach delay and LOS).*
- *All-way stop controlled (AWSC) LOS is reported for the overall intersection, based on average delay per vehicle*

Nine intersections were found to operate below local minimum service standards in either the morning or evening peak period. More intersections fail in the Existing plus Project and West Area Specific Plan Scenario due to the increased volumes of trips associated with the West Area Specific Plan.

5.4.2 EXISTING PLUS PROJECT AND WEST AREA SPECIFIC PLAN CONDITIONS FREEWAY CAPACITY ANALYSIS

Table 17 and **Table 18** document the findings of a capacity analysis focused on the US 101 study segments through Salinas in the Existing Plus Project and West Area Specific Plan Conditions scenario for the morning and evening peak periods, respectively.

TABLE 17: AM EXISTING PLUS PROJECT AND WEST AREA SPECIFIC PLAN FREEWAY MAINLINE OPERATION ANALYSIS

The Northbound Off-Ramps at East Boronda Road and East Laurel Street perform at LOS E, which is below the minimum standards set by the County CMP.

6.0 CUMULATIVE VOLUMES AND LEVEL OF SERVICE

The future effects of the Central Area Specific Plan and the West Area Specific Plan were evaluated against the projected volumes and operations of the transportation network assuming growth as a result of partial implementation of the adopted general plan as of the year 2045. The roadway network improvements included in the City's General Plan, including the eastside and westside bypasses, are reflected in the cumulative analyses. The following sections detail the forecasting methods and results of this analysis.

6.1 TRAVEL DEMAND FORECASTING METHODS AND ASSUMPTIONS

The Salinas Travel Demand model (the model) includes all of Monterey County, California, including the City of Salinas. It is a four-step model, using trip generation, trip distribution, mode choice and trip assignment as well as localized land use and roadway network attributes in order to create estimates for travel behavior and patterns.

The model was used to forecast travel to and from a specific area, or zone, based on the land use information for that zone. Land use information includes the number and size of households and the number and type of jobs.

6.1.1.1 Linear Interpolation of the Cumulative Horizon Year Forecast

The model was initially developed with a horizon year of 2063 in order to reflect the conditions anticipated to prevail with buildout of the City's General Plan. As such, it includes all of the land use changes and transportation network improvements included in the General Plan. The land use changes from the proposed Economic Development Element are also included.

By contrast, 2045 is the cumulative horizon year used in this Transportation Impact Analysis. In order to produce traffic forecasts based on changes in land use for 2045 (instead of 2063; General Plan transportation network changes are assumed to have occurred by 2045), land use conditions were interpolated by assuming growth in a linear manner between the base and horizon years. While actual land use growth may follow economic cycles and not an exact linear trend, this assumption is relatively consistent with recent and historical trends in the City.

6.1.1.2 Adjusting Model Outputs

Travel demand models such as the one used in this report provide volume outputs that need to be adjusted in order to develop volume forecasts for the scenario being tested. In principle, raw volume outputs from a travel demand model should rarely be applied directly in analysis, only being used after adjustments are made. Adjustments to forecasted volumes are usually based on the difference between or ratio of volumes observed in the field and the model's own prediction of existing volumes.

The rationale for adjusting raw model volume outputs is that observed travel behavior is the result of a highly complex mixture of variables, only some of which are included in any given travel demand model, and so an adjustment is needed to account for variables not captured by the model itself. The adjustment takes the form of changing the model outputs to correct for discrepancies between the base year field counts and the base year model volumes identified during the local calibration process, as it is assumed that the discrepancy will likely affect all scenarios in the same order of magnitude. This can be done several ways, as defined in the *National Cooperative Highway Research Program Report 255: Highway Traffic Data for Urbanized Area Project Planning and Design*, Transportation Research Board, December 1982[8]. The three most common industry-standard procedures for adjusting model traffic forecasts for both link and turning movement volumes are described below.

6.1.1.3 Difference Method

The difference between the base year field count and the base year model volume is added to the output model volume to develop the forecasted volume for the scenario being tested. For example, if the base year model volume for a roadway segment was 650 ADT while the field count was 700 ADT, then the difference method would suggest the output model volume on that roadway segment should be increased by 50 ADT to develop the forecasted volume for the scenario being tested. The difference method adjustment is summarized in the formula below.

Scenario Forecast = Output Model Volume + (Field Count – Base Year Model Volume)

6.1.1.4 Ratio Method

The ratio method is similar, except that it uses the ratio of the base year field count and the base year model volume to make the adjustment. For example, if the base year model volume for a roadway segment was 650 ADT while the field count was 700 ADT, then the ratio method would suggest the output model volume

[8] http://teachamerica.com/tih/PDF/nchrp255.pdf

should be increased by 7.7% (700 / 650 = 1.077) to develop the forecasted volume for the scenario being tested. The ratio method adjustment is summarized in the formula below.

*Scenario Forecast = Output Model Volume * (Field Count / Base Year Model Volume)*

6.1.1.5 Blended Method

The blended method takes the average of the ratio method and the difference method scenario forecasts. The blended method adjustment is summarized in the formula below.

Scenario Forecast = (Difference Method Scenario Forecast + Ratio Method Scenario Forecast) / 2

The most appropriate adjustment method is left to the judgment of the engineer for each project. However, there are guidelines that the Transportation Research Board[9] has published based on the difference between base year field counts and base year model volumes: use the ratio method if the difference is less than 50%, use the difference method if the difference is greater than 150%, otherwise use the blended method.

This methodology was followed for the production of forecasts. In cases where the model was unable to produce volume at a specific intersection or roadway, an annual growth rate of .75% (based on regional growth, industry standards and engineering judgement) was applied to the observed volumes to forecast the 2045 no project volume. In some locations, particularly around the project access points, some volumes were re-routed based on details of the internal circulation network of the project.

6.1.1.6 Roadway Cumulative Network Changes

The following roadway network changes were assumed as part of all cumulative scenarios and are included in the model (these changes are presented in **Figure 11**):

- Boronda Road was widened to 4 lanes from 2 lanes between Williams Road and San Juan Grade Road.
- As shown earlier in **Figure 2**, the internal circulation network for the Central Area Specific Plan was added to the model. The network is consistent with the plan document and includes access points on Natividad Road, Boronda, Old Stage Road, the planned extensions of Russell Road, Constitution Boulevard, Hemingway Drive and Independence Boulevard.
- When necessary, the West Area Specific Plan was added to the model network. The network is consistent with the plan document and includes access points on Boronda Road, Natividad Road,

[9] *National Cooperative Highway Research Program Report 255, Highway Traffic Data for Urban Area Project Planning and Design*, Transportation Research Board, N.J. Pederson and D.R. Samdahl

San Juan Grade, and Rogge Road. Extensions of Russell Road, El Dorado Drive and other internal roadway connections were added.

In the cumulative scenarios which include the General Plan roadway network the following roadway improvements have also been coded into the model (also reflected on **Figure 11**):

- 4-lane divided arterial extending "Western Bypass" south of SR 183 to the intersection of Blanco Road and Davis Road.
- 4-lane divided arterial "Eastside Bypass" from the Boronda Road/Williams Road intersection to Harris Road at US 101
- 4 lane arterial extension of Alvin Drive across US 101 to connect with the Western Bypass
- 2 lane arterial extension of West Rossi Street from North Davis Road to the Western Bypass
- Widening of Russell Road from 2 to 4 lanes from San Juan Grade Road to North Main Street
- Widening of San Juan Grade Road from 2 to 4 lanes from Boronda Road to Rogge Road
- Widening of Old Stage Road from 2 to 4 lanes from Williams Road to Natividad Road
- Widening of Williams Road to 4 lanes from Del Monte Avenue to Old Stage Road
- Widening of South Sanborn Road to 6 lanes from Abbott Street to John Street
- Southernly extension of Constitution Boulevard from East Laurel Drive to Kern Street
- Extension of Maryal Drive from Bernal Drive to the new extension of Constitution Boulevard

AWSC = All-Way Stop Control, SSSC = Side Street Stop Control, LOS = Level of Service

Notes:

- *SSSC intersection LOS is reported as: overall intersection delay and LOS (worst-case stop-controlled movement or approach delay and LOS). AWSC LOS is reported for the overall intersection, based on average delay per vehicle*

Fourteen intersections were found to function below the City thresholds for acceptable level of service (D or better) during the morning and/or evening peak period. Of these, seven operate at LOS F during one or both peak periods for the intersection as a whole: US 101 Southbound Ramps/Echo Valley Road/Crazy Horse Canyon Road, Crazy Horse Canyon Road/San Juan Grade Road, Old Stage Road/Williams Road, South Davis Road/Blanco Road, Sherwood Drive/Natividad Road/East Bernal Drive/La Posada Way, Natividad Road/East Laurel Drive and North Main Street/West Laurel Drive.

6.2.1.2 Cumulative with No Project Conditions Freeway Mainline Capacity Analysis

Ten segments of US 101 through Salinas were analyzed using methodology from the Highway Capacity Manual in the Cumulative Conditions scenario. This Cumulative scenario includes the roadway network changes described in Section 6.1.1.6. Results for the morning peak period are shown below in **Table 22** and evening results are shown in **Table 23**.

San Miguel Canyon Road to SR 156 was found to operate at LOS E in northbound direction during the AM peak period, LOS F in the evening peak hour in the southbound direction and LOS E in the evening peak in the northbound direction. San Juan Grade Road to Crazy Horse Canyon Road operates at LOS E and LOS D in the south and northbound directions during the evening peak period. SR 156 to Sala Road rated LOS E in the southbound direction during the evening peak hour.

6.2.1.3 Cumulative with No Project Conditions Freeway Ramp Junction Capacity Analysis

Capacity analyses for ramp junctions were prepared at two interchanges along US 101 in Salinas. The results of this analysis for the morning and evening peak period are shown in **Table 24** and **Table 25**, respectively.

TABLE 24: AM CUMULATIVE WITH NO PROJECT RAMP MERGE AND DIVERGE ANALYSIS

All ramp junctions perform at or above the minimum standards set by the County CMP.

6.3 CUMULATIVE PLUS PROJECT CONDITIONS

6.3.1.1 Cumulative plus Project Conditions Intersection Operation Analysis

The Cumulative Conditions Plus Project scenario models the overall change in traffic volumes in Salinas as a result of forecast development, with the addition of the proposed project. The intent is to understand how the proposed project will influence travel behavior in light of future conditions, and to identify possible significant future impacts. The results of this analysis are shown in **Table 26** below.

TABLE 26: CUMULATIVE PLUS PROJECT INTERSECTION OPERATION ANALYSIS

Source: Fehr & Peers, 2019
AWSC = All-Way Stop Control, SSSC = Side Street Stop Control, LOS = Level of Service
Notes:

- *Side-street stop-controlled (SSSC) intersection LOS is reported as: overall intersection delay and LOS (worst-case stop-controlled movement or approach delay and LOS).*
- *All-way stop controlled (AWSC) LOS is reported for the overall intersection, based on average delay per vehicle*

Overall, sixteen intersections were found to operate below the local minimum LOS threshold in the morning and/or evening peak period. Intersections that operate below the local threshold as a result of project-related traffic are considered project contributions to significant cumulative impacts. Mitigations are discussed further in the next section.

6.3.1.2 Cumulative plus Project Conditions Freeway Mainline Capacity Analysis

The Travel Demand Model was also used to forecast vehicle volumes on the ten study segments of US 101. This Cumulative scenario includes the roadway network changes described in Section 6.1.1.6. **Table 27** shows the morning peak period results, **Table 28** shows the evening results. LOS scores are compared to the minimum operating standards defined by the County CMP in the tables below.

TABLE 27: AM CUMULATIVE PLUS PROJECT FREEWAY MAINLINE OPERATION ANALYSIS

Similar to the Cumulative Conditions results, San Juan Road to Crazy Horse Canyon Road, San Miguel Canyon Road to SR 156, and SR 156 to Sala Road all fall below the minimum LOS standards in the evening periods. In the morning period San Miguel Canyon Road to SR 156 falls below the LOS standard.

6.3.1.3 Cumulative plus Project Freeway Ramp Junction Capacity Analysis

Capacity analyses for ramp junctions were analyzed at two interchanges along US 101 in Salinas. The results of this analysis for Cumulative Plus Project scenario during the morning and evening peak period are shown in **Table 29** and **Table 30**, respectively**.**

All ramp junctions perform at or above the minimum standards set by the County CMP.

6.5 VEHICLE MILES TRAVELLED

The consumption of roadway network capacity can also be measured with vehicle-miles travelled (VMT). Overall, VMT represents how often and how far people drive. Increases in VMT are often tied to new trips from new land development projects and/or changes in land use that result in increased development intensity and related increases in vehicle trips. In this analysis, the Salinas Travel Demand Model is used to evaluate VMT in the following scenarios:

1. Existing Conditions;
2. Existing with Project;
3. Existing with Project and West Area Specific Plan;
4. Cumulative without Project;
5. Cumulative with Project Conditions; and
6. Cumulative with Project and West Area Specific Plan.

The model does not have the ability to add households in the base year condition, so the Existing with Project, and Existing with Project and West Area Specific Plan scenarios could not be forecasted with that approach. Instead, VMT results for the existing scenarios were estimated by adding the incremental change in VMT from the cumulative year scenarios to the Existing Conditions VMT.

Table 36 and **Table 37** below summarize the change in VMT generated by both the Central Area Specific Plan and the West Area Specific Plan, as well as Salinas. In each case, the absolute VMT is shown. For the City and County, it is shown on a per-capita basis. For the Central Area Specific Plan and the West Area Specific Plan, VMT is shown on a per-trip basis as the project adds additional employment and employee trips cannot be isolated; using a per-capita number for the Central Area Specific Plan and the West Area Specific Plan would overstate the VMT generated due to increases in population. At each location, the VMT generated as a result of existing conditions and each forecast scenario is also presented.

Overall, the addition of the proposed project increases VMT in the existing and cumulative scenarios and the addition of the proposed project with West Area Specific Plan increases VMT to a similar extent on a per capita basis.

7.0 IMPACTS AND MITIGATIONS

7.1 VEHICLE TRAFFIC OPERATIONS IMPACTS AND MITIGATIONS

Based on the model results and guiding policies from the City, several intersections were found to suffer from deteriorating LOS scores and/or delay as a result of traffic generated by the proposed project under the existing and cumulative with project conditions scenarios. Impacts are considered to be significant if the addition of project-related traffic reduces LOS scores to E or worse, or if the project adds additional traffic to an intersection already performing at E or worse. Intersections which operate below standards independent of project-related traffic are not considered a significant impact.

This section documents the impacts and proposed mitigations for the Existing plus Project Conditions and Cumulative plus Project Conditions scenarios. This section also discusses the fair-share contribution for each mitigation in the Cumulative plus Project Conditions scenario that the project proponent should be expected to contribute based on the ratio of project-related volume to non-project related volume and growth.

7.1.1 EXISTING PLUS PROJECT CONDITIONS IMPACTS AND MITIGATIONS

Impact E.1: North Main Street & Laurel Drive (32)

This intersection was found to experience worsened vehicle delay while operating at LOS E in the evening peak period with the addition of project traffic. Delays at the intersection would deteriorate from 56.7 seconds per vehicle under the Existing condition to 57.4 seconds per vehicle under the Existing plus Project condition in the evening peak hour, which is a significant adverse impact based on the City’s significance standards.

Mitigation E.1: Optimize existing signal timings. This mitigation was found to improve level of service to LOS D, with 48.6 seconds of delay during the evening peak hour. As this impact is a result of project traffic, the project applicant shall be responsible for its funding and implementation at the project approval stage. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.2: Natividad Road & East Laurel Drive (33)

This intersection was found to experience worsened delay as a result of project-related trips in the morning and evening peak period, from LOS D to LOS E for both peak periods. In the AM peak hour, delays at the intersection would deteriorate from 54.9 seconds per vehicle under the Existing condition to 65.0 seconds per vehicle under the Existing plus Project condition. In the PM peak hour, delays at the intersection would deteriorate from 48.9 seconds per vehicle under the Existing condition to 61.0 seconds per vehicle under the Existing plus Project condition. These deteriorations are considered to be significant adverse impacts based on the City's significance standards.

Mitigation E.2: The proposed mitigation is to widen the intersection to add additional northbound and southbound through lanes. This mitigation was found to improve the level of service to D, with 52.3 seconds of delay and 51.5 seconds of delay in the morning and evening peak periods, respectively. This improvement is part of the City's Traffic Improvement Program (Project Number 61). Payment of the City of Salina's Traffic Impact Fees will mitigate the project's impact at this location. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.3: North Sanborn Road/Boronda Road (35)

This intersection was found to experience worsened delay and level of service as a result of the project trips in the existing scenarios. Under the Existing plus Project condition, this intersection's worst movement would operate with more than 150 seconds of delay in the AM and PM peak hours. The intersection would meet peak hour traffic signal warrants in the Existing plus Project scenario. These deteriorations are considered to be significant adverse impacts based on the City's significance standards.

Mitigation E.3: Install a traffic signal. This mitigation was found to improve level of service to C in the morning peak hour and LOS B during the evening peak hour, with 34.4 seconds of delay and 15.5 seconds of delay, respectively. As this impact is a result of project traffic, the project applicant shall be responsible for its funding and implementation at the project approval stage. Alternatively, a roundabout that would reduce traffic to the same LOS (or better) is also acceptable. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.4: Sherwood Drive/Natividad Road & East Bernal Drive/La Posada Way (38)

With the addition of project traffic, this intersection was found to experience worsened delay in the morning and evening peak periods, from LOS D (41.9 seconds per vehicle) and LOS E (60 seconds per vehicle), respectively, to LOS E and LOS F (57.2 and 73.9 seconds per vehicle). These deteriorations are considered to be significant adverse impacts based on the City's significance standards.

Mitigation E.4: Optimize existing signal timings and add an eastbound left turn pocket. The proposed mitigation is to add an eastbound left turn pocket and optimize the existing signal timing to better accommodate the expected changes in traffic distribution and volume in the with-project scenario. The proposed mitigation was found to improve LOS in the morning and evening peak periods to LOS B, with 15.7 seconds of delay and 15.3 seconds of delay, respectively. As this impact is a result of project traffic, the project applicant shall be responsible for its funding and implementation at the project approval stage. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.5: South Sanborn/North Sanborn/John Street (45)

The addition of traffic associated with the Central Area Specific Plan project would degrade the operation of this intersection from LOS D with 44.6 seconds per vehicle of delay to LOS E with 73.0 seconds per vehicle of delay during the morning peak hour. This degradation in service is considered to be a significant adverse impact based on the City's significance standards.

Mitigation E.5: Optimize Signal Timing. The optimization of the existing traffic signal timing and splits at this uncoordinated intersection would mitigate the identified impact. With the implementation of this measure the operation of the intersection would improve to LOS C with 28.0 seconds of delay per vehicle during the morning peak hour. As this impact is a result of project traffic, the project applicant shall be responsible for its funding and implementation at the project approval stage. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.6: US 101 Ramp Junctions

With the addition of project trips, the following ramp junctions are expected to function below County CMP standards during the PM peak hour:

- US 101 Northbound Boronda Road Off-Ramp: LOS E (35.1 passenger cars per vehicle per lane).
- US 101 Northbound West Laurel Drive Off-Ramp: LOS E (35.6 passenger cars per vehicle per lane).

Mitigation E.6: Contribution to the TAMC RDIF Program and payment of the City of Salina's Traffic Impact Fees. The proposed mitigation for this impact is the project's required contribution to the Transportation Agency for Monterey County (TAMC) Regional Development Impact Fee (RDIF) Program and the City of Salina's Traffic Impact Fee (TIF) Program. These programs include improvements to US 101 that would improve mainline and ramp junction operations, which would mitigate this project impact.

7.1.2 EXISTING PLUS PROJECT AND WEST AREA SPECIFIC PLAN IMPACTS AND MITIGATIONS

Impacts observed in the Existing plus Project and West Area Specific Plan Conditions scenario are documented and mitigations proposed below.

Impact E.7: San Juan Grade Road & Van Buren Avenue (14)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this unsignalized intersection's worst movement from LOS C in the morning peak hour and LOS D in the evening peak hour to LOS F during both peak hours of travel (with greater than 150 seconds of delay per vehicle). Traffic levels under the Existing plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse impact based on the City's significance standards.

Mitigation E.7: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A for both peak periods, with 6.9 and 6.0 seconds of delay during the AM and PM peak hours, respectively. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.8: North Main Street & East Boronda Road (17)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this intersection from LOS D (46.2 seconds per vehicle) to LOS E (62.9 seconds per vehicle) during the evening peak hour. This degradation in service level is considered to be a significant adverse impact based on the City's significance standards.

Mitigation E.8: Optimize Signal Timing. The optimization of the existing traffic signal timing and splits at this coordinated intersection would mitigate the identified impact. With the implementation of this measure the operation of the intersection would improve to LOS D with 50.3 seconds of delay per vehicle during the evening peak hour. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.9: San Juan Grade Road & Boronda Road (19)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this intersection from LOS D (42.7 seconds per vehicle) to LOS F (88.8 seconds per vehicle) during the evening peak hour. This degradation in service level is considered to be a significant adverse impact based on the City's significance standards.

Mitigation E.9: Optimize Signal Timing. The optimization of the existing traffic signal timing and splits at this coordinated intersection would mitigate the identified impact. With the implementation of this measure the operation of the intersection would improve to LOS D with 42.1 seconds of delay per vehicle during the evening peak hour. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.10: North Main Street/West Laurel Drive (32)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this intersection from LOS E with 56.7 seconds per vehicle of delay to LOS E with 72.1 seconds per vehicle of delay during the evening peak hour. This degradation in service is considered to be a significant adverse impact based on the City's significance standards.

Mitigation E.10: Optimize Signal Timing. The optimization of the existing traffic signal timing and splits at this coordinated intersection would mitigate the identified impact. With the implementation of this measure the operation of the intersection would improve to LOS D with 50.4 seconds of delay per vehicle during the evening peak hour. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.11: Natividad Road & East Laurel Drive (33)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this intersection from LOS D (54.9 seconds per vehicle) to LOS F (106.7 seconds per vehicle) during the morning peak hour and from LOS D (48.9 seconds per vehicle) to LOS F (90.1 seconds per vehicle) during the evening peak hour. These degradations in service levels are considered to be significant adverse impacts based on the City's significance standards.

Mitigation E11: Add northbound through lane, southbound through lane and convert the eastbound right turn lane to a shared through-right turn lane. With this improvement, the operation of the intersection in this scenario would improve to LOS D (52.2 seconds per vehicle) in the morning peak hour and LOS D (52.5 seconds per vehicle) in the evening peak hour. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.12: North Sanborn Road/Boronda Road (35)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this unsignalized intersection's worst movement from LOS F (123.6 seconds of delay per vehicle) in the morning peak hour and LOS E (38.4 seconds of delay per vehicle) in the evening peak hour to LOS F during both peak hours of travel (with greater than 150 seconds of delay per vehicle). Traffic levels under the Existing plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse impact based on the City's significance standards.

Mitigation E.12: Install traffic signal and add eastbound right turn pocket. The addition of a traffic signal and eastbound right turn pocket will improve the intersection's LOS to D in the morning peak hour (40.6 seconds of delay per vehicle) and LOS C (21.8 seconds of delay per vehicle) in the evening peak hour. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.13: Sherwood Drive/Natividad Road & East Bernal Drive/La Posada Way (38)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this intersection from LOS D (41.9 seconds per vehicle) to LOS F (116.0 seconds per vehicle) during the morning peak hour and from LOS E (60.0 seconds per vehicle) to LOS F (93.0 seconds per vehicle) during the evening peak hour. These degradations in service levels are considered to be significant adverse impacts based on the City's significance standards.

Mitigation E13: Add eastbound left turn pocket and optimize traffic signal timings. With this improvement, the operation of the intersection in this scenario would improve to LOS C (21.8 seconds per vehicle) in the morning peak hour and LOS C (23.0 seconds per vehicle) in the evening peak hour. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.14: Williams Road & East Boronda Road (40)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this unsignalized intersection's worst movement from LOS D (25.9 seconds of delay per vehicle) to LOS F during the PM peak hour (with greater than 150 seconds of delay per vehicle). Traffic levels under the Existing plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse impact based on the City's significance standards.

Mitigation E.14: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A in the evening peak hour (7.1 seconds of delay per vehicle). With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.15: South Sanborn/North Sanborn/John Street (45)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this intersection from LOS D with 44.6 seconds per vehicle of delay to LOS E with 73.5 seconds per vehicle of delay during the morning peak hour. This degradation in service is considered to be a significant adverse impact based on the City's significance standards.

Mitigation E.15: Optimize Signal Timing. The optimization of the existing traffic signal timing and splits at this uncoordinated intersection would mitigate the identified impact. With the implementation of this measure the operation of the intersection would improve to LOS C with 33.1 seconds of delay per vehicle during the morning peak hour. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.16: Salinas Street/Main Street/Market Street (55)

The addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects would degrade the operation of this intersection from LOS C (28.4_seconds per vehicle) to LOS F (95.0 seconds per vehicle) during the morning peak hour and from LOS C (29.5 seconds per vehicle) to LOS E (62.7 seconds per vehicle) during the evening peak hour. These degradations in service levels are considered to be significant adverse impacts based on the City's significance standards.

Mitigation E19: Add southbound left turn pocket and optimize traffic signal timings. With this improvement, the operation of the intersection in this scenario would improve to LOS D (54.0 seconds per vehicle) in the morning peak hour and LOS D (37.8 seconds per vehicle) in the evening peak hour. With the implementation of the identified mitigation measure, the impact would be less than significant.

Impact E.17: US 101 Ramp Junctions

With the addition of traffic associated with both the Central Area Specific Plan and West Area Specific Plan projects, the following ramp junctions are expected to function below County CMP standards during the PM peak hour:

- US 101 Northbound Boronda Road Off-Ramp: LOS E (36.6 passenger cars per vehicle per lane).
- US 101 Northbound West Laurel Drive Off-Ramp: LOS E (37.0 passenger cars per vehicle per lane).

Mitigation E17: Contribution to the TAMC RDIF Program and payment of the City of Salina's Traffic Impact Fees. The proposed mitigation for this impact is the project's required contribution to the Transportation Agency for Monterey County (TAMC) Regional Development Impact Fee (RDIF) Program and the City of Salina's Traffic Impact Fee (TIF) Program. These programs include improvements to US 101 that would improve mainline and ramp junction operations, which would mitigate this project impact.

7.1.3 CUMULATIVE PLUS PROJECT IMPACTS AND MITIGATIONS

Impacts observed in the Cumulative plus Project Conditions scenario are documented and mitigations proposed below.

Impact C.1: US 101 Southbound Ramps/Echo Valley Road/Crazy Horse Canyon Road (1)

The addition of Project generated traffic to the Cumulative baseline condition would further degrade the operation of this unsignalized intersection's worst movement while operating at LOS F (with greater than 150 seconds of delay per vehicle) during the evening peak hour. Traffic levels under the Cumulative plus Project scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.1: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to B with 16.0 seconds of delay per vehicle under the Cumulative plus Project condition during the evening peak hour. While the project could make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact, there is no mechanism to ensure the full funding and completion of the improvement. Thus, this cumulative impact is considered to be significant and unavoidable.

Impact C.2: US 101 Northbound Ramps/Crazy Horse Canyon Road (2)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement while operating in LOS E during the evening peak hour. Traffic levels under the Cumulative plus Project scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.2: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A with 8.6 seconds of delay per vehicle under the Cumulative plus Project condition during the evening peak hour. While the project could make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact, there is no mechanism to ensure the full funding and *completion of the improvement. Thus, this cumulative impact is considered to be significant and unavoidable.*

Impact C.3: Crazy Horse Canyon Road & San Juan Grade Road (5)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this all-way stop controlled intersection from LOS F with 109.7 seconds of delay per vehicle to LOS F with 122.3 seconds of delay per vehicle during the evening peak hour. Traffic levels under the Cumulative plus Project scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.3: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A with 8.8 seconds of delay per vehicle under the Cumulative plus Project condition during the evening peak hour. While the project could make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact, there is no mechanism to ensure the full funding and completion of the improvement. Thus, this cumulative impact is considered to be significant and unavoidable.

Impact C.4: Natividad Road & Rogge Road (12)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement while operating in LOS E during the evening peak hour. Traffic levels under the Cumulative plus Project scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.4: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to B with 10.6 seconds of delay per vehicle under the Cumulative plus Project condition during the evening peak hour. While the project could make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact, there is no mechanism to ensure the full funding and completion of the improvement. Thus, this cumulative impact is considered to be significant and unavoidable.

Impact C.5: Natividad Road & Russell Road (13)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement from LOS F with 51.0 seconds of delay per vehicle to LOS F with greater than 150 seconds of delay per vehicle during the evening peak hour. Traffic levels under the Cumulative plus Project scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.5: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A with 8.8 seconds of delay per vehicle under the Cumulative plus Project condition during the evening peak hour. This intersection is to be constructed as part of the Project, and the project should fully fund the installation of a traffic signal at this location. With this mitigation, the Project's contribution to this significant adverse cumulative impact will be fully mitigated.

Impact C.6: North Main Street & East Boronda Road (17)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this intersection from LOS E with 70.2 seconds of delay per vehicle to LOS E with 79.1 seconds of delay per vehicle during the evening peak hour. This degradation in operations is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.6: Install southbound left turn lane and westbound right turn lane. The addition of additional southbound and westbound turn lanes at this location will improve the intersection's LOS to E with 73.0 seconds of delay per vehicle under the Cumulative plus Project condition during the evening peak hour. The project should make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact. As the City has been collecting funds from other development projects to improve this intersection, this contribution would mitigate the Project's contribution to the significant adverse cumulative impact at this location.

Impact C.7: North Main Street & West Laurel Drive (32)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this intersection from LOS F with 161.4 seconds of delay to LOS F with 164.1 seconds of delay per vehicle during the evening peak hour. This degradation in operations is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.7: Install northbound right turn overlap phase. The addition of a northbound right turn overlap phase at this location will improve the intersection's LOS to F with 150.3 seconds of delay per vehicle during the evening peak hour in the Cumulative plus Project condition. While the project could make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact, there is no mechanism to ensure the full funding and completion of the improvement. Thus, this cumulative impact is considered to be significant and unavoidable.

Impact C.8: Natividad Road & East Laurel Drive (33)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this intersection from LOS E with 73.9 seconds of delay to LOS F with 85.3 seconds of delay per vehicle during the morning peak hour and from LOS F with 85.1 seconds of delay to LOS F with 97.9 seconds of delay per vehicle in the evening peak hour. This degradation in operations is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.8: Install northbound and southbound through lanes. The addition of northbound and southbound through lanes at this location will improve the intersection's LOS to E with 72.3 seconds of delay per vehicle during the morning peak hour and LOS F with 83.0 seconds of delay per vehicle in the evening peak hour in the Cumulative plus Project condition. This improvement is part of the City's Traffic Improvement Program (Project Number 61). Payment of the City of Salina's Traffic Impact Fees will mitigate the project's contribution to the cumulative impact at this location.

Impact C.9: Constitution Boulevard & East Laurel Drive (34)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this intersection from LOS D with 54.5 seconds of delay per vehicle to LOS F with 86.8 seconds of delay in the AM peak hour and from LOS E with 68.4 seconds of delay per vehicle to LOS F with 116.8 seconds of delay per vehicle during the evening peak hour. This degradation in operations is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.9: Install southbound left turn lane. The addition of a southbound left turn lane at this location will improve the intersection's LOS to E with 57.4 seconds of delay per vehicle during the morning peak hour and LOS F with 88.4 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Project condition. While the project could make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact, there is no mechanism to ensure the full funding and completion of the improvement. Thus, this cumulative impact is considered to be significant and unavoidable

Impact C.10: Old Stage Road & Williams Road (36)

The addition of Project generated traffic to the Cumulative baseline condition would further degrade the operation of this unsignalized intersection's worst movement while operating at LOS F (with greater than 150 seconds of delay per vehicle) during the evening peak hour. Traffic levels under the Cumulative plus Project scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.10: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A with 12.5 seconds of delay per vehicle under the Cumulative plus Project condition during the evening peak hour. While the project could make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact, there is no mechanism to ensure the full funding and completion of the improvement. Thus, this cumulative impact is considered to be significant and unavoidable.

Impact C.11: North Main Street & East Bernal Drive (37)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this intersection from LOS E with 56.7 seconds of delay to LOS E with 57.8 seconds of delay per vehicle during the morning peak hour and from LOS E with 68.6 seconds of delay to LOS E with 69.0 seconds of delay per vehicle in the evening peak hour. This degradation in operations is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.11: Install northbound through lane, add in northbound right turn overlap phase and convert westbound through lane to westbound shared through-left turn lane. The addition of these improvements at this location will improve the intersection's LOS to D with 47.1 seconds of delay per vehicle during the morning peak hour and LOS E with 60.4 seconds of delay per vehicle in the evening peak hour in the Cumulative plus Project condition. While the project could make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact, there is no mechanism to ensure the full funding and completion of the improvement. Thus, this cumulative impact is considered to be significant and unavoidable.

Impact C.12: Sherwood Drive/Natividad Road & East Bernal Drive/La Posada Way (38)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this intersection from LOS F with 72.0 seconds of delay to LOS E with 75.0 seconds of delay per vehicle during the morning peak hour and from LOS F with 122.3 seconds of delay to LOS F with 136.4 seconds of delay per vehicle in the evening peak hour. This degradation in operations is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.12: Install northbound and southbound through lanes. The addition of these improvements at this location will improve the intersection's LOS to E with 56.4 seconds of delay per vehicle during the morning peak hour and LOS E with 57.1 seconds of delay per vehicle in the evening peak hour in the Cumulative plus Project condition. While the project could make a fair-share contribution to mitigate its contribution to this significant cumulative adverse impact, there is no mechanism to ensure the full funding and completion of the improvement. Thus, this cumulative impact is considered to be significant and unavoidable.

Impact C.13: Williams Road/East Boronda Road (40)

The addition of traffic generated by the Central Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS D with 39.3 seconds of delay per vehicle to LOS E with 72.6 seconds of delay per vehicle in the evening peak hour. This degradation in operations is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.13: Install eastbound left turn lane. The addition of this improvement will improve the intersection's LOS to C with 33.0 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Project condition. This improvement is part of the City's Traffic Improvement Program (Project Number 54). Payment of the City of Salina's Traffic Impact Fees will mitigate the project's contribution to the cumulative impact at this location.

Impact C.14: South Davis Road & Blanco Road (53)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this intersection from LOS F with 184.3 seconds of delay to LOS F with 186.7 seconds of delay per vehicle during the morning peak hour and from LOS F with 144.7 seconds of delay to LOS F with 145.4 seconds of delay per vehicle in the evening peak hour. This degradation in operations is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.14: Install westbound left turn lane. The addition of a westbound left turn lane at this location will improve the intersection's LOS to F with 152.5 seconds of delay per vehicle during the morning peak hour and LOS F with 119.0 seconds of delay per vehicle in the evening peak hour in the Cumulative plus Project condition. This improvement is part of the City's Traffic Improvement Program (Project Number 73). Payment of the City of Salina's Traffic Impact Fees will mitigate the project's contribution to the cumulative impact at this location.

Impact C.15: Main Street/Blanco Road (56)

The addition of Project generated traffic to the Cumulative baseline condition would degrade the operation of this intersection from LOS E with 69.6 seconds of delay to LOS E with 69.8 seconds of delay per vehicle in the evening peak hour. This degradation in operations is considered to be a Project contribution to a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.15: Install northbound left turn lane. The addition of a northbound left turn lane at this location will improve the intersection's LOS to D with 47.7 seconds of delay per vehicle in the evening peak hour in the Cumulative plus Project condition. This improvement is part of the City's Traffic Improvement Program (Project Number 59). Payment of the City of Salina's Traffic Impact Fees will mitigate the project's contribution to the cumulative impact at this location.

Impact C.16: US 101 Mainline Segments

With the addition of project trips, the following segments of US 101 are expected to function below County CMP standards:

- AM US 101 Northbound between San Miguel Canyon Road and SR 156: LOS is E with a density of 40.6
- PM US 101 Southbound between San Juan Road and Crazy Horse Canyon Road; LOS is F with a density of 47.2
- PM US 101 Southbound and Northbound between San Miguel Canyon Road and SR 156: The forecasted LOS is F with a density of 68.0 southbound; northbound is LOS F with a density of 47.2
- PM US 101 Southbound between SR 156 and Sala Road: the forecasted LOS is F with a density of 50.3 southbound

Mitigation C.16: Contribution to the TAMC RDIF Program and City's TIF Program: The proposed mitigation for this cumulative impact is the project's required contribution to the Transportation Agency for Monterey County (TAMC) Regional Development Impact Fee (RDIF) Program and the City's Traffic Impact Fee Program (TIF).

7.1.4 CUMULATIVE PLUS PROJECT AND WEST AREA SPECIFIC PLAN CONDITIONS IMPACTS AND MITIGATIONS

Impacts observed in the Cumulative plus Project and West Area Specific Plan Conditions scenario are documented and mitigations proposed below.

Impact C.17: US 101 Southbound Ramps/Echo Valley Road/Crazy Horse Canyon Road (1)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would further degrade the operation of this unsignalized intersection's worst movement while operating at LOS F (with greater than 150 seconds of delay per vehicle) during the evening peak hour. Traffic levels under the Cumulative plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.17: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to B with 17.8 seconds of delay per vehicle under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition during the evening peak hour.

Impact C.18: US 101 Northbound Ramps/Crazy Horse Canyon Road (2)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement from LOS E with 43.7 seconds of delay per vehicle to LOS F with 54.4 seconds of delay per vehicle during the evening peak hour. Traffic levels under the Cumulative plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.18: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A with 8.6 seconds of delay per vehicle under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition during the evening peak hour.

Impact C.19: Crazy Horse Canyon Road/San Juan Grade Road (5)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement from LOS F with 109.7 seconds of delay per vehicle to LOS F with greater than 150 seconds of delay per vehicle during the evening peak hour. Traffic levels under the Cumulative plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.19: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to B with 10.0 seconds of delay per vehicle under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition during the evening peak hour.

Impact C.20: Old Stage Road/Hebert Road (7)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement from LOS C with 19.7 seconds of delay per vehicle to LOS E with 36.3 seconds of delay per vehicle during the evening peak hour. Traffic levels under the Cumulative plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.20: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A with 5.3 seconds of delay per vehicle under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition during the evening peak hour.

Impact C.21: Natividad Road/Rogge Road (12)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement from LOS E with 47.5 seconds of delay per vehicle to LOS F with 125.0 seconds of delay per vehicle during the evening peak hour. Traffic levels under the Cumulative plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.21: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to B with 13.3 seconds of delay per vehicle under the Cumulative plus Central Area Specific Plan and Wet Area Specific Plan condition during the evening peak hour.

Impact C.22: Natividad Road/Russell Road (13)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement from LOS F with 51.0 seconds of delay per vehicle to LOS F with greater than 150.0 seconds of delay per vehicle during the evening peak hour. Traffic levels under the Cumulative plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.22: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to B with 10.4 seconds of delay per vehicle under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition during the evening peak hour.

Impact C.24: San Juan Grade Road/Van Buren Avenue (14)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement from LOS D with 27.0 seconds of delay per vehicle to LOS F with greater than 150.0 seconds of delay per vehicle during the evening peak hour. Traffic levels under the Cumulative plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.24: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A with 6.7 seconds of delay per vehicle under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition during the evening peak hour.

Impact C.25: North Main Street/Boronda Road (14)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS E with 70.2 seconds of delay per vehicle to LOS F with 117.2 seconds of delay per vehicle during the evening peak hour. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.25: Install southbound left turn lane and westbound right turn lane. The addition of these improvements will improve the intersection's LOS to E with 68.5 seconds of delay per vehicle under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition during the evening peak hour.

Impact C.26: Natividad Road/Boronda Road (22)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS A with 5.6 seconds of delay per vehicle to LOS F with 57.7 seconds of delay per vehicle during the evening peak hour. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.26: No further physical improvements are possible at this location. The intersection would be built-out as a three-lane roundabout, and further widening would not be possible, thus, this impact is considered to be significant and unavoidable.

Impact C.27: Natividad Road/East Laurel Drive (33)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS E with 73.9 seconds of delay per vehicle to LOS F with 118.7 seconds of delay per vehicle during the morning peak hour and from LOS F with 85.1 seconds of delay per vehicle to LOS F with 116.8 seconds of delay per vehicle in the evening peak hour. These degradations in service levels are considered to be significant adverse cumulative impacts based on the City's significance standards.

Mitigation C.27: Install northbound and southbound through lanes and convert the existing eastbound right turn lane to a shared through-right turn lane. The addition of these improvements will improve *the intersection's LOS to E with 70.5 seconds of delay per vehicle during the morning peak hour and to LOS E with 72.3 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition.*

Impact C.28: Constitution Boulevard/East Laurel Drive (34)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS D with 54.4 seconds of delay per vehicle to LOS F with 82.8 seconds of delay per vehicle during the morning peak hour and from LOS E with 68.4 seconds of delay per vehicle to LOS F with 114.2 seconds of delay per vehicle in the evening peak hour. These degradations in service levels are considered to be significant adverse cumulative impacts based on the City's significance standards.

Mitigation C.28: Install eastbound and southbound left turn lanes. The addition of a third eastbound left turn lane would necessitate the construction of a third northbound receiving lane on Constitution Boulevard for several hundred feet north of the intersection. The addition of these improvements will improve the intersection's LOS to D with 42.9 seconds of delay per vehicle during the morning peak hour and to LOS E with 57.4 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition.

Impact C.29: North Sanborn Road/Boronda Road (35)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS C with 28.2 seconds of delay per vehicle to LOS F with 83.1 seconds of delay per vehicle in the evening peak hour. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.29: Install westbound left turn lane. The addition of this improvement will improve the intersection's LOS to C with 34.5 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition.

Impact C.30: Old Stage Road/Williams Road/Private Road (36)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this unsignalized intersection's worst movement while operating at LOS F with greater than 150 seconds of delay in both the morning and evening peak hours. Traffic levels under the Cumulative plus Central Area Specific Plan and West Area Specific Plan scenario at this intersection would also be sufficient to meet peak hour warrants for the installation of a traffic signal. These degradations in service levels are considered to be significant adverse cumulative impacts based on the City's significance standards.

Mitigation C.30: Install traffic signal. The addition of a traffic signal will improve the intersection's LOS to A with 5.9 seconds of delay per vehicle during the morning peak hour and to LOS B with 11.8 seconds of delay per vehicle under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition.

Impact C.31: North Main Street/East Bernal Drive (37)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS E with 56.7 seconds of delay per vehicle to LOS F with 61.0 seconds of delay per vehicle during the morning peak hour and from LOS F with 68.6 seconds of delay per vehicle to LOS F with 75.7 seconds of delay per vehicle in the evening peak hour. These degradations in service levels are considered to be significant adverse cumulative impacts based on the City's significance standards.

Mitigation C.31: Install a northbound through lane, northbound right turn overlap phase and convert an existing westbound through turn lane to a shared through-left turn lane. The addition of these improvements will improve the intersection's LOS to E with 55.6 seconds of delay per vehicle during the morning peak hour and to LOS E with 65.4 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition.

Impact C.32: Sherwood Drive/Natividad Road/East Bernal Drive/La Posada Way (38)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS F with 72.0 seconds of delay per vehicle to LOS F with 105.0 seconds of delay per vehicle during the morning peak hour and from LOS F with 122.3 seconds of delay per vehicle to LOS F with 165.7 seconds of delay per vehicle in the evening peak hour. These degradations in service levels are considered to be significant adverse cumulative impacts based on the City's significance standards.

Mitigation C.32: Install northbound and southbound through lanes. The addition of these improvements will improve the intersection's LOS to E with 59.9 seconds of delay per vehicle during the morning peak hour and to LOS E with 63.0 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition.

Impact C.33: Williams Road/East Boronda Road (40)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS D with 39.3 seconds of delay per vehicle to LOS F with 108.2 seconds of delay per vehicle in the evening peak hour. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.33: Install eastbound left turn lane. The addition of this improvement will improve the intersection's LOS to D with 37.3 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition. This improvement is part of the City's Traffic Improvement Program (Project Number 54).

Impact C.34: East Front Street/Sherwood Drive/Market Street (51)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS C with 31.9 seconds of delay per vehicle to LOS E with 66.8 seconds of delay per vehicle in the evening peak hour. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.34: Install southbound left turn lane. The addition of this improvement will improve the intersection's LOS to D with 46.3 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition.

Impact C.35: South Davis Road/Blanco Road (53)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS F with 184.9 seconds of delay per vehicle to LOS F with 189.2 seconds of delay per vehicle during the morning peak hour and from LOS F with 144.7 seconds of delay per vehicle to LOS F with 146.5 seconds of delay per vehicle in the evening peak hour. These degradations in service levels are considered to be significant adverse cumulative impacts based on the City's significance standards.

Mitigation C.35: Install a westbound left turn lane. The addition of this improvement will improve the intersection's LOS to F with 154.6 seconds of delay per vehicle during the morning peak hour and to LOS F with 120.0 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition. This improvement is part of the City's Traffic Improvement Program (Project Number 73).

Impact C.36: Salinas Street/North Main Street/West Market Street/East Market Street (55)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS D with 37.1 seconds of delay per vehicle to LOS F with 98.3 seconds of delay per vehicle during the morning peak hour and from LOS D with 46.4 seconds of delay per vehicle to LOS F with 102.3 seconds of delay per vehicle in the evening peak hour. These degradations in service levels are considered to be significant adverse cumulative impacts based on the City's significance standards.

Mitigation C.36: Install an eastbound through lane and southbound left turn lane. The addition of this improvement will improve the intersection's LOS to D with 44.6 seconds of delay per vehicle during the morning peak hour and to LOS D with 38.6 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition.

Impact C.37: South Main Street/Blanco Road (56)

The addition of traffic generated by the Central Area Specific Plan and West Area Specific Plan projects to the Cumulative baseline condition would degrade the operation of this intersection from LOS E with 67.4 seconds of delay per vehicle to LOS E with 71.8 seconds of delay per vehicle in the evening peak hour. This degradation in service level is considered to be a significant adverse cumulative impact based on the City's significance standards.

Mitigation C.37: Install northbound left turn lane. The addition of this improvement will improve the intersection's LOS to D with 49.3 seconds of delay per vehicle during the evening peak hour under the Cumulative plus Central Area Specific Plan and West Area Specific Plan condition. This improvement is part of the City's Traffic Improvement Program (Project Number 59).

Impact C.38: US 101 Mainline Segments

With the addition of project trips and trip associated with the West Area Specific Plan, the following segments of US 101 are expected to function below County CMP standards:

- AM US 101 Northbound between San Juan Road and Crazy Horse Canyon Road; LOS is E with a density of 38.2.
- AM US 101 Northbound and Southbound between San Miguel Canyon Road and SR 156: LOS is F, with a density of 45.2 northbound; southbound is LOS E with a density of 37.8.
- PM US 101 Southbound and Northbound between San Juan Road and Crazy Horse Canyon Road; LOS is F with a density of 54.0 southbound; LOS is E with a density of 36.0 northbound.
- PM US 101 Southbound between Crazy Horse Canyon Road and San Miguel Canyon Road; LOS is E with a density of 35.0.
- PM US 101 Southbound and Northbound between San Miguel Canyon Road and SR 156: The forecasted LOS is F with a density of 81.9 southbound; northbound is LOS F with a density of 52.7.
- PM US 101 Southbound between SR 156 and Sala Road: the forecasted LOS is F with a density of 58.0 southbound.

Mitigation C.38: Contribution to the TAMC RDIF Program and City's TIF Program: The proposed mitigation for this cumulative impact is the project's required contribution to the Transportation Agency for Monterey County (TAMC) Regional Development Impact Fee (RDIF) Program and the City's Traffic Impact Fee Program (TIF).

7.1.5 TRANSPORTATION DEMAND MANAGEMENT (TDM)

As shown, the proposed project will have many significant impacts on the transportation network. Therefore, the City should consider implementing a transportation demand management (TDM) program as part of the Central Area Specific Plan entitlement process. In conjunction with roadway capacity expansions, a TDM program could potentially alleviate the traffic impacts of continued population and employment growth over time by encouraging and/or incentivizing employees to take transit, ride bicycles, walk, vanpool, or carpool to work. Typically, the goal of a TDM program is to reduce the number of people driving alone who work at a location in the plan's scope.

Transportation Demand Management programs can take many forms and are typically comprised of individual measures which employ different strategies for reducing commute trips. Most applicable to the proposed project would be a TDM plan that encompasses any or all of the following measures that are referred to as Commute Trip Reduction (CTR) measures. These are enumerated at length in the 2010 report prepared by the California Air Pollution Control Officers' Association (CAPCOA), *Quantifying Greenhouse*

Gas Mitigation Measures. Potential TDM strategies from the CAPCOA document that could be implemented within the EDE areas include the following:

- *Transit fare subsidy*: Employers provide employees with a subsidized (in part or in full) transit fare and/or transfer. In some cases, the Internal Revenue Service (IRS) may consider this cost as a pre-tax deduction for the employer.
- *Employee parking cash-out:* Employees who are provided a free parking space at the employer's expense may instead elect for a cash payment from the employer equivalent to the cost of the parking space in exchange for foregoing it.
- *Workplace parking pricing:* Instead of providing a free parking space at the employer's expense, employees are required to instead pay for a parking space on their own.
- *Alternative work schedules and telecommute programs:* When feasible, employers allow their employees to work remotely from home, or hold flex hours which allow for commute travel outside of typical commute hours.
- *Commute trip reduction marketing program:* Employers distribute educational literature to their employees about alternative transportation options, usually in conjunction with other CTR measures.
- *Employer-sponsored Vanpool/Shuttle:* When feasible, employers may provide or charter private shuttles or van-pools for their employees.
- *Ride-share program:* A variety of strategies may be undertaken by the employer to encourage employees to carpool to work. Typically, these include reserving a certain number of parking spaces for carpools only, designating loading and unloading areas for ride-sharing vehicles, and providing a website or message board for coordinating rides.
- *Unbundling of Residential Parking Costs*: Encouraging landlords to separate the cost of parking from rent can help to both lower overall rents while dis-incentivizing car ownership or multiple-car households. This may also help concurrent programs that encourage alternative commute modes.
- *Carshare Programs*: Car share companies, such as ZipCar, offer by-the-hour rental business models, can help households who have one or no cars to make necessary trips via automobile on a per-trip rate.

There are many options to implement TDM programs. In some cases, a local jurisdiction may require new development to adopt, monitor, and show proof of a TDM plan as a part of the entitlement process. In other instances, TDM elements may be incorporated into a General Plan or other policy document in the form of requirements for new businesses to include safe bicycle parking; Policy C-4.3 of the existing 2002 City of Salinas General Plan encourages existing and requires new businesses to provide bicycle parking. Other cities may formally codify these policies into their municipal ordinance.

In order to ameliorate the significant and unavoidable impacts that result from the proposed project, the City should implement a TDM program that is related to the Central Area Specific Plan.

7.2 TRANSIT IMPACTS

According to Policy C-3.1 and Policy C-3.2 of the existing 2002 Salinas General Plan, the City shall support Monterey-Salinas Transit (MST) in developing frequent and effective public transportation service, including to new development areas. The Central Area Specific Plan is estimated to generate approximately 800 new transit trips on a daily basis, as well as 130 trips in the morning peak hour and 140 trips in the evening peak hour. These new transit trips alone are not expected to overburden existing transit service in the area. Additionally, this project does not conflict with an existing transit-related policy or plan in the City. As such, this project will have **no significant impacts** on public transit service.

The Specific Plan also proposes a Public Transit Plan which was developed based on input from MST. The transit plan is subject to change and the final routing and siting of bus shelters and stops will be subject to the approval of MST and the City of Salinas. It is recommended that City work with Monterey-Salinas Transit to implement service within and throughout the Specific Plan Area.

7.3 BICYCLE AND PEDESTRIAN IMPACTS

Overall, existing plans and policies are supportive of bicycling and walking in Salinas. City policies related to biking and walking are defined in the existing General Plan Circulation Element through Goal C-4 and Goal C-5. Together, these goals set citywide policies that provide for safe and accessible bicycle and pedestrian facilities. Additionally, the 2002 Salinas Bikeways Plan and 2004 Salinas Pedestrian Plan provide prioritized lists of projects and programs in service of the above goals. In accordance with the standards of significance, the proposed project would not have significant impacts on the bicycle and pedestrian network because the Specific Plan does not interfere with existing plans or policies related to biking and/or walking.

The proposed project is expected to generate approximately 1,900 daily walking and biking trips; 280 of which are anticipated in the morning peak hour and 240 of which are anticipated in the evening peak hour. The proposed project includes specifications to include new bicycle and pedestrian facilities that will provide access to the site. Therefore, there will be **no significant impacts** to bicycle or pedestrian facilities.

7.3.1 BICYCLE IMPACTS

Safe and adequate bicycle facilities are proposed throughout the Specific Plan area. Therefore, there are **no significant impacts** as a result of the proposed project.

7.3.2 PEDESTRIAN IMPACTS

East Boronda Road has a sidewalk on its southern portion for the road's entire extent. It does not have a sidewalk on the northern portion. According to the Central Area Specific Plan document, the proposed project will install continuous sidewalks along the northern side of East Boronda Road and throughout the Specific Plan area.

Safe and adequate pedestrian facilities are proposed throughout the Specific Plan area. Therefore, there are **no significant impacts** as a result of the proposed project.

APPENDIX A: CENTRAL AREA SPECIFIC PLAN TRIP GENERATION RATE ASSUMPTIONS

ITE Trip Generation land use category (520) - Elementary School (Adj. Streets, 4-6P)
Daily: T = 1.29(X)
AM Peak Hour: T = 0.45(X) (55% in, 45% out)
PM Peak Hour: T = 0.15(X) (49% in, 51% out)

ITE Trip Generation land use category (522) - Middle School/Junior High School (Adj Streets, 4-6P)
Daily: T = 1.62(X)
AM Peak Hour: T = 0.54(X) (55% in, 45% out)
PM Peak Hour: T = 0.16(X) (49% in, 51% out)

ITE Trip Generation land use category (530) - High School (Adj Streets, 4-6P)
Daily: T = 1.71(X),
AM Peak Hour: T = 0.43(X) (68% in, 32% out)
PM Peak Hour: T = 0.13(X) (47% in, 53% out)

ITE Trip Generation land use category (710) - General Office Building (Pk Hr, AM & PM)
Daily: T = 11.03(X)
AM Peak Hour: Ln(T) = 0.80 * ln(X) + 1.57 (88% in, 12% out)
PM Peak Hour: T = 1.12(X) + 78.45 (17% in, 83% out)

ITE Trip Generation land use category (850) - Supermarket (Adj Streets, 7-9A, 4-6P)
Daily: T = 102.24(X)
AM Peak Hour: T = 3.40(X) (62% in, 38% out)
PM Peak Hour: T = 9.48(X) (51% in, 49% out)

ITE Trip Generation land use category (820) - Shopping Center (Adj Streets, 7-9A, 4-6P)
Daily: T = 42.70(X)
AM Peak Hour: T = 0.96(X) (62% in, 38% out)
PM Peak Hour: T = 3.71(X) (48% in, 52% out)

ITE Trip Generation land use category (210) - Single-Family Detached Housing (Adj Streets, 7-9A, 4-6P)
Daily: T = 9.52(X)
AM Peak Hour: T = 0.70(X) + 9.74 (25% in, 75% out)
PM Peak Hour: T = 1.00(X) (63% in, 37% out)

ITE Trip Generation land use category (230) - Residential Condominium/Townhouse (Pk Adj Streets, 7-9A, 4-6P)
Daily: T = 5.81(X)
AM Peak Hour: Ln(T) = 0.80 * ln(X) + 0.26 (17% in, 83% out)
PM Peak Hour: Ln(T) = 0.82 * ln(X) + 0.32 (67% in, 33% out)

ITE Trip Generation land use category (220) - Apartment (Adj Streets, 7-9A, 4-6P)
Daily: T = 6.65(X)
AM Peak Hour: T = 0.51(X) (20% in, 80% out)
PM Peak Hour: T = 0.55(X) + 17.65 (65% in, 35% out)

ITE Trip Generation land use category (590) - Library (Adj Streets, 7-9A, 4-6P)
Daily: T = 56.24(X)
AM Peak Hour: T = 1.04(X) (71% in, 29% out)
PM Peak Hour: T = 7.30(X) (48% in, 52% out)

ITE Trip Generation land use category (411) - City Park (Adj Streets, 7-9A, 4-6P)
Daily: T = 1.89(X)
AM Peak Hour: T = 4.50(X) (56% in, 44% out)
PM Peak Hour: T = 3.50(X) (57% in, 43% out)

ITE Trip Generation land use category (170) - Utilities (Adj Streets, 7-9A, 4-6P)
Daily: T = 0.00(X)
AM Peak Hour: T = 2.49(X) (63% in, 37% out)
PM Peak Hour: T = 1.32(X) (45% in, 55% out)

Reductions based on application of MXD+ model:
Total Reductions: Daily = 10.7%, AM Peak Hour = 20.8%, PM Peak Hour = 22.1%
Internal Capture: Daily = 8.6%, AM Peak Hour = 17.2%, PM Peak Hour = 18.6%
External Walk, Bike, and Transit: Daily = 2.1%, AM Peak Hour = 3.6%, PM Peak Hour = 3.5%
