

## Examples of Successful CBP3 Programs

The CBP3 program approach was first envisioned through a series of workshops led by U.S. EPA Region 3 (Mid-Atlantic) that brought together leading experts in the alternative project delivery, public infrastructure finance, GSI technology, and public sector innovation.

### Prince George's County, MD

Since its launch in 2015, the 30-year Clean Water Partnership (CWP) between EPA Region 3 and Prince George's County Department of Environmental Protection (MD) has already successfully treated 2,000 acres of impervious area for under the target budget of \$100M while exceeding community outcomes related to local job creation and disadvantaged business utilization. Phase II of the program plans to treat an additional 2,000 impervious acres.

### City of Chester, PA

In 2018, the bankrupt City of Chester, PA, initiated a CBP3 program to comply with municipal stormwater requirements and revitalize the local economy. In Phase I of the 30 year program, the City aims to invest \$50M in green stormwater infrastructure. The City of Chester's CBP3 program has helped to develop and establish the City's stormwater authority and provide optimal value for revenues dedicated to stormwater infrastructure.

## How can the Salinas community benefit?

Every inch of rain that falls in the City of Salinas drains to an impaired waterbody, while the entire City sits atop a severely overdrafted groundwater basin. The Salinas Clean Stormwater Program (SCSP) will focus on the delivery and long-term maintenance of GSI assets and urban pollutant control solutions at low cost. A purpose-built CBP3 crafted to address the City's priorities is an opportunity to build local environmental resilience and empower the Salinas community to contribute and directly benefit.

The CBP3 model puts the community needs at the forefront, which have included local job creation through trainings, local small/minority/woman-owned business assistance, community involvement and participation to improve local stewardship, property owner education programs, and more. Residents become the trained workforce to execute the program vision and in turn, residents become stewards that benefit socially and economically from the improvements they implement and maintain.
